X2Y® FILTER & DECOUPLING CAPACITORS

The X2Y® Design - A Capacitive Circuit

X2Y® components share many common features with standard multi-layer ceramic capacitors (MLCC) for easy adoption by end-users.

- Same component sizes (0603, 0805, 1206, etc.)
- Same dielectric, electrode and termination materials
- Same pick and place equipment
- Same industry test standards for component reliability

A standard multi-layer ceramic capacitor (MLCC) consists of opposing electrode layers A & B. The X2Y® design adds another set of electrode layers (G) which effectively surround each existing electrode of a two-terminal capacitor. The only external difference is two additional side terminations, creating a four-terminal capacitive circuit, which allows circuit designers a multitude of attachment options.

X2Y® Circuit 1: Filtering

When used in circuit 1 configuration the X2Y® filter capacitor is connected across two signal lines. Differential mode noise is filtered to ground by the two Y capacitors, A & B. Common mode noise is cancelled within the device.

Experts agree that balance is the key to a “quiet” circuit. X2Y® is a balanced circuit device with two equal halves, tightly matched in both phase and magnitude with respect to ground. Several advantages are gained by two balanced capacitors sharing a single ceramic component body.

- Exceptional common mode rejection
- Effect of voltage variation eliminated
- Effects of aging & temperature are equal on both caps
- Matched line-to-ground capacitance

InAmp Input Filter Example

In this example, a single Johanson X2Y® component was used to filter noise at the input of a DC instrumentation amplifier. This reduced component count by 3-to-1 and costs by over 70% vs. conventional filter components that included 1% film Y-capacitors.

Parameter	X2Y® 10nF	Discrete 10nF, 2 @ 220 pF	Comments
DC offset shift	< 0.1 μ V	< 0.1 μ V	Referred to input
Common mode rejection	91 dB	92 dB	

Source: Analog Devices, “A Designer’s Guide to Instrumentation Amplifiers (2nd Edition)” by Charles Kitchin and Lew Counts

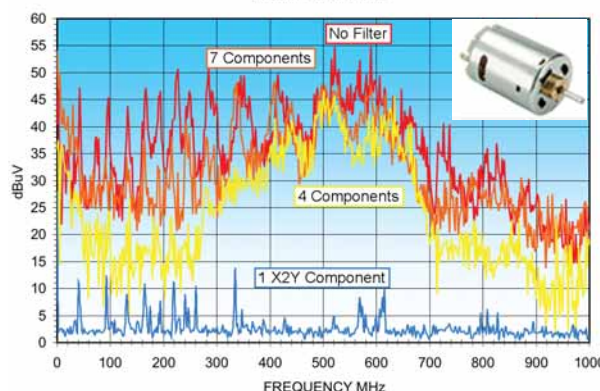

Common Mode Choke Replacement

In this example, a 5 μ H common mode choke is replaced by an 0805, 1000pF X2Y® component achieving superior EMI filtering by a component a fraction of the size and cost.

DC Motor EMI Reduction: A Superior Solution

One X2Y® component has successfully replaced 7 discrete filter components while achieving superior EMI filtering.

X2Y® FILTER & DECOUPLING CAPACITORS

X2Y® Circuit 2: Decoupling

When used in circuit 2 configuration, A & B capacitors are placed in parallel effectively doubling the apparent capacitance while maintaining an ultra-low inductance. The low inductance advantages of the X2Y® Capacitor Circuit enables high-performance bypass networks at reduced system cost.

- Low ESL (device only and mounted)
- Broadband performance
- Effective on PCB or package

- Lower via count, improves routing
- Reduces component count
- Lowers placement cost

Component Performance

The X2Y® has short, multiple and opposing current paths resulting in lower device inductance.

Mounted Performance

Mutual coupling from opposing polarity vias lowers inductance when mounted on a PCB.

SYSTEM PERFORMANCE

1:5 MLCC Replacement Example

X2Y's® proven technology enables end-users to use one X2Y capacitor to replace five conventional MLCCs in a typical high performance IC bypass design. Vias are nearly cut in half, board space is reduced and savings are in dollars per PCB.

X2Y® FILTER & DECOUPLING CAPACITORS

X2Y® filter capacitors employ a unique, patented low inductance design featuring two balanced capacitors that are immune to temperature, voltage and aging performance differences.

These components offer superior decoupling and EMI filtering performance, virtually eliminate parasitics, and can replace multiple capacitors and inductors saving board space and reducing assembly costs.

ADVANTAGES

- One device for EMI suppression or decoupling
- Replace up to 7 components with one X2Y
- Differential and common mode attenuation
- Matched capacitance line to ground, both lines
- Low inductance due to cancellation effect

APPLICATIONS

- FPGA / ASIC / μ -P Decoupling
- DDR Memory Decoupling
- Amplifier Filter & Decoupling
- High Speed Data Filtering
- Cellular Handsets

Use of solder mask beneath component is not recommended.

Good Layout

Poor Layout

Figure 1

OPTIMIZING X2Y PERFORMANCE WITH PROPER ATTACHMENT TECHNIQUES

X2Y® capacitors excel in low inductance performance for a myriad of applications including EMI/RFI filtering, power supply bypass / decoupling. How the capacitor is attached to the application PCB is every bit as important as the capacitor itself. Proper attention to pad layout and via placement insures superior device performance. Poor PCB layouts squander performance, requiring more capacitors, and more vias to do the same job. Figure 1 compares the X2Y® recommended layout against a poor layout. Because of its long extents from device terminals to vias, and the wide via separation, the poor layout shown performs badly. It exhibits approximately 200% L1 inductance, and 150% L2 inductance compared to recommended X2Y layouts.

For further details on via placement and it's effect on mounted inductance, please refer to X2Y Attenuators, LLC. application note "Get the Most from X2Y Capacitors with Proper Attachment Techniques" at www.x2y.com/bypass.htm
