

##  A Division of Powers Holdings, I nc.

Curtis Industries is recognized as a leader in RFI Power Line Filters. We focus on five key areas to insure high quality filters and total customer satisfaction using the latest technology. These key areas include Customer Satisfaction, Design Engineering, Manufacturing, Quality, and On-Time Delivery.

Customer Satisfaction is carried out throughout Curtis. Customer interface with our friendly and knowledgeable Customer Service Representative where all the information needed for order entry, processing, shipping, pricing, and order expediting are immediately available electronically.

Design Engineering is able to create new designs to solve our OEM customer's requirements. Using the Solid Works modeling technology enables our engineers to design the optimum filter or custom control package.

Quality is designed, built in and verified on every filter to the following.

- Hi Pot - DC Line to Line
- Hi Pot - AC Line to Ground
- Current Leakage
- Ground Continuity
- Capacitance Line to Line
- Capacitance Line to Ground
- Inductance Line
- Inductance Ground
- Cross Wiring

Manufacturing uses proprietary techniques with semi and full automation to build in quality and reduce thru-put. We deliver 99.9\% reliable product to meet our customer's quality objectives.

On-Time Delivery is a focus for everyone at Curtis which has resulted in an on-time delivery greater than 98\% on time.

## Features:

- Designed for General Purpose Common Mode and Differential Mode Applications
- Higher Line-to-Line Capacitance for

Protection from Pulsed,
Intermittent, or Continuous RFI

- Available in Standard (F1200) and LowLeakage (F1250) (F1260) (F1270) (F1280) (F1290) Models
- Available with Integral IEC Connector up to 10Amps

## F1200/F1250 Simplified Schematic

## Specifications:

Rated Voltage: 250VAC Maximum - $50 / 60 \mathrm{~Hz}$
Rated Current:

| 115VAC | 1 A | 3 A | 6 A | 10 A | 20 A | 30 A |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: |
| 250VAC | 1 A | 2.5 A | 4 A | 6 A | 10 A | 15 A |

Current Overload: 6X for 8 seconds
Hi-Pot Test (1 min): F1200 Series
Line to Ground:
1500VAC
Line to Line:
1768VDC

Insulation Resistance: $9 \times 10^{9} \Omega$ at 100 VDC
Ambient Temperature: $40^{\circ} \mathrm{C}$ Max at rated current
Humidity Range: 0\% to 95\% R.H.
Termination:
A: QC - Quick Connect
C: IEC Receptacle
B: Wire
D: Screw

Maximum Leakage Current:

| Each Line to Ground | F1200 | F1250 | F1260 | F1270 | F1280 | F1290 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: |
| $115 \mathrm{VAC}, 60 \mathrm{~Hz}:$ | 0.40 mA | 0.25 mA | .15 mA | .002 mA | .015 mA | .030 mA |
| $250 \mathrm{VAC}, 50 \mathrm{~Hz}:$ | .75 mA | .40 mA | .25 mA | .005 mA | .025 mA | .050 mA |

F1600FA
(3 and 6Amp)
Dimensions

Refer to Page 36 for Standard Mounting Cutouts

## Features:

- General Purpose — Designed for Applications with Higher Differential Mode Noise
- Higher Line-to-Line Capacitance for Protection from Pulsed, Intermittent or Continuous RFI
- A Cost-Effective Replacement for Independent Coil Design in Many SMPS Applications
- Available with Integral IEC Connector

## F1700 Simplified Schematic

## Specifications:

Rated Voltage: 250VAC Maximum - $50 / 60 \mathrm{~Hz}$ Rated Current: 115VAC 250VAC

| $3 A$ | $2.5 A$ |
| ---: | ---: |
| $6 A$ | $4 A$ |
| $10 A$ | $6 A$ |
| $20 A$ | $10 A$ |
| $30 A$ | $15 A$ |

Current Overload: 6X for 8 seconds Hi-Pot Test (1 min):

| Line to Ground | 1500VAC |
| :--- | :--- |
| Line to Line | 1768 VDC |

Insulation Resistance: $9 \times 10^{9} \Omega$ at 100 VDC
Ambient Temperature: $40^{\circ} \mathrm{C}$ Max. at rated current
Humidity Range: $0 \%$ to $95 \%$ R.H.
Termination:
A: QC - Quick Connect
B: Wire
C: IEC Receptacle
D: Screw
Maximum Leakage Current:

| Each Line to Ground | F1700 | F1710 | F1720 | F1740 |
| :--- | :---: | :---: | :---: | :---: |
| 115VAC, 60Hz: | 0.40 mA | .15 mA | .002 mA | .060 mA |
| 250VAC, $50 \mathrm{~Hz}:$ | 0.75 mA | .25 mA | .005 mA | .120 mA |

Agency Approvals:

Except 30Amp

- High Inductance Single Coil Design Provides High Common Mode and Differential Mode Performance Above 150 KHz
- High-Frequency Construction Techniques Maintain $>50 \mathrm{~dB}$ Insertion Loss from 10 MHz to 1 GHz
- Compact, Space-Saving Package Available in 3, 6 and 10-Amp Ratings

## F5500 Simplified Schematic

Specifications:
Rated Voltage: 250 VAC Maximum - $50 / 60 \mathrm{~Hz}$
Rated Current: 115VAC 250VAC

| $3 A$ | $3 A$ |
| ---: | :--- |
| $6 A$ | $4 A$ |
| $10 A$ | $6 A$ |

Current Overload: 6X for 8 seconds
Hi-Pot Test (1 min):

$$
\begin{array}{ll}
\text { Line to Ground } & 1400 \mathrm{VDC} \\
\text { Line to Line } & 1450 \mathrm{VDC}
\end{array}
$$

Insulation Resistance: $9 \times 10^{9} \Omega$ at 100 VDC
Ambient Temperature: $40^{\circ} \mathrm{C}$ Max. at rated current
Humidity Range: $0 \%$ to $95 \%$ R.H.
Termination:
C: IEC Receptacle
G: Wire Wrap/Solder
Maximum Leakage Current:

| Each Line to Ground | F5500 |
| :--- | :--- |
| 115VAC, 60Hz: | 0.25 mA |
| 250VAC, $60 \mathrm{~Hz}:$ | 0.50 mA |

## Standard Mounting Cutouts

## How to Order

The Curtis part numbering system is made up of four elements. Each element denotes a specific requirement (mechanical or electrical) which, when properly sequenced, fully identifies the required catalog filter. As shown, the first five alpha/numeric characters denote the series type; the sixth character (alpha) denotes the type of line termination; the seventh character (alpha) denotes the type of load termination; the last two characters (numeric) denote the current rating.
Compose your part number as follows: Select the series required, add two alpha character for the line and load termination, followed by two numeric characters for the required current rating. For example, F1100AB06 completely identifies an F 1100 series filter with quick connects on line side and wire leads on load side, with a 6 -amp rating.

| F1100 | X X | X |
| :---: | :---: | :---: |
| SERIES - |  | CURRENT |
| PE = Power Entry |  | RATING |
| PM $=$ Medical |  | $01=1 \mathrm{Amp}$ |
| Power Entry |  | $03=3 \mathrm{Amps}$ |
|  |  | $06=6 \mathrm{Amps}$ |
| LINE TERMINATION |  | $10=10 \mathrm{Amps}$ |
| A = Quick Connects |  | $15=15 \mathrm{Amps}$ |
| $B=$ Wire Leads | LOAD | $20=20 \mathrm{Amps}$ |
| C= IEC Connector | TERMINATION | $30=30 \mathrm{Amps}$ |
| D= Screw Terminals | A = Quick Connects |  |
| (20 \& 30 amp only) | $B=$ Wire Leads |  |
| $F=$ Fused IEC | $D=$ Screw Terminals |  |
| $\mathrm{P}=$ Printed Circuit Pins | (20 \& 30 amp only) |  |
| W= Dual Fused IEC | $\mathrm{P}=$ Printed Circuit Pins |  |
| J = Switched IEC | S = Solder Tab |  |

Features:

- Designed to Meet UL544 Specification for Medical and Dental Equipment. Available to UL/IEC 60601 Standard
- F3400/F3500 Have Enhanced Differential Mode Performance
- Effective in Other Low-Leakage Current Applications

F3000/F3100/F3200 Series Simplified Schematic

## Specifications:

Rated Voltage: 250VAC Maximum - $50 / 60 \mathrm{~Hz}$
Rated Current: 115VAC 250VAC
3A 3A

Current Overload: 6X for 8 seconds Hi-Pot Test (1 min):
Line to Ground
1500VAC
Line to Line
1768VDC

Insulation Resistance: $9 \times 10^{9} \Omega$ at 100 VDC
Ambient Temperature: $40^{\circ} \mathrm{C}$ Max at rated current Humidity Range: 0\% to 95\% R.H. Termination:

A: QC - Quick Connect
C: IEC Receptacle
Maximum Leakage Current:
Each Line to Ground F3000 Series 115VAC, 60Hz: $\quad 2 \mu \mathrm{~A}$ 250VAC, $50 \mathrm{~Hz}: \quad 5 \mu \mathrm{~A}$

## Features:

- General Purpose "L-Type" Circuit Effective in Reducing Both Incoming and Outgoing Powerline Noise Levels in FCC "A" Applications
- Integral $5 \times 20 \mathrm{~mm}$ Single or Dual Fused IEC Connector
- Optional SST Switched IEC Connector
- Low-Leakage
- Available to UL/IEC 60601 Standard and Meets UL 544 Specification for Medical and Dental Applications
- Available in Labor-Saving PC Mounted Case Style

## PE9/PM9

(3 and 6Amp)
Dimensions

Refer to Standard Mounting Cutouts Below

## How to Order

## INSTALLATION INSTRUCTION <br> IMPORTANT - CHANGING FUSEIVOLTAGE

## PE7/PE8/PE9

To change fuse, remove power cord and open the front cover on the module. Remove fuse holder and replace fuse. Reinsert fuse holder and close cover. To change the operating voltage on the PE7/PM7 and PE9/PM9 Series, remove the power cord and open front cover. Rotate voltage select wheel until desired voltage appears in window of cover.

- Filter shipped without fuse.

Always use caution when selecting and changing fuses and voltage requirements. Curtis Industries is not responsible for malfunction due to improper installation/selection of fuse and/or voltage select.

Standard Mounting Cutouts

Screw-Mount Series

## Features:

- RFI Filter Module Combines IEC Connector, Fusing, Optional Voltage Select and On/Off Switch into a Single, Space-Efficient Assembly
- Enhanced Low Frequency Response with No Resonant Peaks
- Fully Shielded for Radiative Noise Control
- Accepts Either U.S. or European Standard Fuse Sizes. Dual or Single Power Line Fusing
- Available to ULIIEC 60601 Standard and Meets UL 544 Specification for Medical and Dental Applications

## Specifications:

WITH VOLTAGE SELECTOR

## How to Order

## PE1

## INSTALLATION INSTRUCTION IMPORTANT - CHANGING FUSE/VOLTAGE

## PE1/PM1

To change fuse, remove power cord. Remove voltage selector and replace fuse. Reinsert fuse holder. To change the operating voltage on the PE1/PM1 Series, remove the power cord and rotate fuse holder block until desired voltage aligns with the mark on the module housing.

- Filter shipped without fuse.

Always use caution when selecting and changing fuses and voltage requirements. Curtis Industries is not responsible for malfunction due to improper installation/selection of fuse and/or voltage select.

## THREE-PHASE FILTERS]

## Specifications:

Rated Voltage: 480 VAC - $50 / 60 \mathrm{~Hz}$ 600 VAC - $50 / 60 \mathrm{~Hz}$
Rated Current: 480 VAC - 9A to 608A 600 VAC - 8A to 600A
Current Overload: 6X for 8 seconds

Hi-Pot Test (1 min):
Line to Ground
Line to Line

480VAC
2210 VDC
2780 VDC

600VAC
3150 VDC
3150 VDC

Insulation Resistance: $1000 \mathrm{M} \Omega \mathrm{min}$. at 250 VDC
Ambient Temperature: $0^{\circ} \mathrm{C}$ to $40^{\circ} \mathrm{C}\left(32^{\circ} \mathrm{F}\right.$ to $\left.104^{\circ} \mathrm{F}\right)$
Humidity Range: 0\% to $95 \%$ R.H.
Termination:

- Wire
- Terminal Blocks
- Pressure Terminal Blocks

Weight: 3 to 65 lbs ( 1.36 to 29.50 kg )
Agency Approvals:
게 (

Designed to attenuate conducted interference in a small package providing excellent insertion loss, the F3480/F3600 series filters will provide effective EMC solutions up to 600A at 600VAC and power applications up to 360 kVA . With effective noise suppression in the critical $150 \mathrm{kHz}-30 \mathrm{MHz}$ range, this advanced 2-stage filter line will support both Delta and Wye connected loads. Curtis three phase filters are designed to provide EMC solutions in many applications such as:

- Motor
- Motor Control Centers
- Facility Filters
- Uninterruptible Power Supplies
- Power Conditioning Units
- Laser Welders
- Automated Test Equipment
- Robotics
- CNC Machinery
- Elevators
- Industrial Ovens

## DC FILTERS ]

## General Purpose

## High Performance

The FD Series of DC filters are designed as a general purpose line of filters for DC applications. They are designed to comply with UL/EN 60950 and UL 1459, CISPER 22 and Telecordia (Bellcore) GR-1089 at 25Amps and above. These filters are available with and without circuit breakers for additional protection.

The FD Series is a compact size that can filter up to 300 MHz ideally suited for the telecom-datacom market. The FDO Series is available from 6Amps to 100Amps in the smallest, economical package. The FD02 is a high frequency filter up to $3 \mathrm{GHz}(3,000 \mathrm{MHz})$ in a compact package.

These filters are ideally used in communications and central office equipment.

- Power Supplies for Communications Equipment
- Network Routing Equipment
- Switching Equipment
- Base Stations
- Modems
- Services
- Ethernet Hubs

## Specifications:

Rated Voltage: 80VDC Maximum

## TECHNICAL CONSIDERATIONS

## Understanding Terminology Technical Considerations

 Conducted Emissions TestingCustom Filter Capabilities

## Understanding Terminology

Curtis Industries, a leading manufacturer of superiorquality electronic and electrical components and assemblies for more than 70 years, offers a complete line of RFI power line filters designed to help your equipment meet FCC and CE requirements on conducted EMI.

Radio frequency interference (RFI) is unwanted noise generated by a wide variety of electronic and electrical devices. Governments of most industrial

countries, including the United States, Canada and the European Union have enacted guidelines on emitted RFI.

Curtis designs quality into every product and then tests for quality by specification compliance, including hipot, component value, grounding and leakage, on a $100 \%$ production basis. We employ a rigorous component qualification program with thorough incoming and on-line inspection procedures. Our computercontrolled $100 \%$ safety and performance testing to demanding customer requirements is your assurance of the highest quality RFI filters available today.

This section provides you with some basic knowledge on terminology and technical information helpful in solving your noise emission in power circuits. For additional information visit our website at www.curtisind.com.

## Definitions

Attenuation: The decrease in intensity or absorption of electromagnetic energy. Expressed in dB.
Conducted Interference: Electromagnetic signals entering a device through direct connection.
Emissions: The level of electromagnetic disturbances equipment causes to its environment.

Filter: Remove electrical noise or interference from the power line by cleaning up the sine wave.
Immunity: The level to which equipment is immune to electromagnetic disturbances in its environment
Impedance: Opposition to the flow of electrical current when a given voltage is applied.
Inductor: Passive component that produces a voltage proportional to the change in current. Measured in Henrys.
Insertion Loss: The electromagnetic signal loss resulting from the insertion of a filter in a transmission line. Expressed in dB.

## What is RFI?

Radio frequency interference (RFI) is the radiation or conduction of radio frequency energy (or electronic noise) produced by electrical and electronic devices at levels that interfere with the operation of adjacent equipment. Frequency ranges of most concern are 10 kHz to 30 MHz (conducted) and 30 MHz to 1 GHz (radiated).

## What causes RFI?

The most common sources include components such as switching power supplies, relays, motors and triacs. These devices are found in a wide variety of equipment used in industrial, medical, white goods, and building HVAC equipment.

## What are the types of RFI?

An electrical or electronic device emits RFI in two ways:

- Radiated RFI is emitted directly into the environment from the equipment itself.
- Conducted RFI is released from components and equipment through the power line cord into the AC power line network. This conducted RFI can affect the performance of other devices on the same network.

## How can RFI be controlled?

- Radiated RFI is usually controlled by providing proper shielding in the enclosure of the equipment.
- Conducted RFI can be attenuated to satisfactory levels by including a power line filter in the system.
The filter suppresses conducted noise leaving the unit, reducing RFI to acceptable levels. It also helps to lower the susceptibility of the equipment to incoming power line noise that can affect its performance.

## What is the government's role in regulating RFI?

Governments and safety agencies of major industrial countries, including the United States, Canada, and the European Union have established noise emission regulations that are focused on digital and other electronic equipment. The most important of these guidelines are FCC CFR 47 (Parts 15 and 18) in the United States and CISPR 11, 14 and 22 in the European Union.

FCC CFR 47 (Part 15) regulates the RF
interference of electronic computing devices, defined as any electronic device or system that generates and uses timing signals or pulses at a rate in excess of 10,000 pulses (cycles) per second and uses digital techniques. This definition includes telephone equipment that utilizes digital techniques and any device or system that generates and uses radio frequency energy for the purpose of performing dataprocessing functions such as electronic computations, operations, transformations, recording, filing, sorting, storage, retrieval or transfer.

FCC regulations are broken down into Class A computing devices marketed for use in commercial, industrial or business environments, and Class B devices intended for use in a residential environment.

The European Union has harmonized the various national regulations and has established the international standards CISPR 11, 14 and 22. CISPR 11 covers industrial, scientific and medical equipment. CISPR 14 covers electrical and thermal appliances and tools. CISPR 22 covers information technology equipment.

In addition to governmental regulations, safety agencies worldwide have established guidelines for all electrical/electronic components. These include UL, CSA and TUV. They are designed to protect against shock and fire hazard.

## How do RFI power line filters work?

Consisting of a multiple-port network of passive components arranged as a dual low-pass filter, the RFI filter attenuates radio frequency energy to acceptable levels, while permitting the power frequency current to pass through with little or no attenuation. Their function, essentially, is to trap noise and to prevent it from entering or leaving your equipment.

RFI is conducted through a power line in two modes. Asymmetric or common mode noise occurs between the line and ground. Symmetric or differential mode is measured from line to line. See the selection guide on page 2 under "Performance."

## Meeting Emissions Standards

The emissions limits that a piece of equipment must meet will depend on the intended market for that piece of equipment. If there is more than one market, more than one emission standard may have to be met. This can have a substantial effect on the circuit, size, and cost of a filter. Standards like the CISPR's or the FCC Rules Part 15 have frequency limits of 150 kHz to 30 MHz .

## FCC 15 AND CISPR CONDUCTED EMISSION LIMITS DIGITAL EQUIPMENT

EMI measurements are generally made using Spectrum Analyzers with Average or Quasi-Peak detectors in accordance with methods described in CISPR 16. Quasi-Peak differs from Average measurements by weight-averaging the peaks into the total.

Equipment meeting these specifications can utilize a filter with a fairly high cutoff frequency. Other standards like FCC 18 with a low frequency limit of 10 kHz will result in the equipment using lower cutoff filters. As might be expected, the lower the cutoff frequency, the larger the physical size and the higher the cost of the filter.

## Conducted RFI Susceptibility

The problem of susceptibility can be extremely difficult to deal with because the amplitude and frequency of the offending RF noise are seldom known and are often intermittent. If the malfunction can be duplicated by isolating the equipment from the power line with LISN's
(Line Impedance Stabilization Network) and using signal generators to inject RF of varying amplitude and frequency, some insight can be gained as to the nature of the problem. However, the criteria for acceptable performance will have to be decided upon so that a filter yielding this level of performance can be obtained from the test procedure. Unfortunately, this still does not eliminate the need for final testing in the actual operating environment which, in many cases, occurs in the field.

Selection of a suitable filter can best be based on the type of power supply or input impedance of the equipment and on the mode of the offending RFI noise.

## Noise Modes

Power line filters attenuate noise in two different modes.
Common Mode: Also known as line-to-ground noise measured between the power line and ground potential.
Differential Mode: Also known as line-to-line noise measured between the lines of power.
Power line filters are designed to attenuate either one or both modes of noise. The need for one design over another will depend on the magnitude of each noise type present. The attenuation is measured in dB (decibels) at various frequencies of signal.

## Circuit Configuration

Power line RFI filters are generally built with two or three-pole filter networks. As the number of poles and the corresponding component count increases, the cost will increase also. Trying to typify an equipment's impedance as either high or low for purposes of filter selection may not be successful. If it is a complex impedance, it could probably be low at some frequencies, high at others, and some intermediate value at still other frequencies.

Although we have been generally successful in recommending a two-pole network for linear power supplies and three-pole networks for switching power supplies and synchronous motors, you should not limit your testing to just one circuit type if either additional circuit performance or lower cost is desired. Consider the following: If the equipment looked strictly capacitive, the performance of a two-pole network would be reduced to that of a single-pole filter.

Figure 1a.
A signal source (E) with its internal impedance driving a capacitive load.

Figure 1b.
The same circuit as in Figure 1a, with the addition of a 2-pole low pass filter. Notice filter capacitor C1 is in parallel with the capacitive load.

Figure 1c.
Combining capacitor C1 in Figure 1b, with the load results in this circuit configuration.

The filter has been reduced to one inductive element, L1.
Obviously a three-pole filter would be preferred for maximum performance. Likewise, if the equipment looked strictly inductive, the performance of a threepole network would be reduced to that of a two-pole network.

Figure 2 a .
A signal source with its internal impedance driving an inductive load.

The same circuit as in Figure 2a, with the addition of a 3-pole low pass filter. Notice filter inductance L2 is in series with the inductive load.

Figure 2c.
Combining inductor L2 in Figure 2b, with the load results in this circuit configuration, the filter has been reduced to two effective elements, L1 \& C1.

Undoubtedly the two-pole filter would be a more economical choice with probably equal performance in this application. Since the equipment is not likely to be equivalent to either one of these simple cases, the only way to find the best cost-effective solution is to test the filters in your equipment and base your judgement on these test results.

## Leakage Current

The maximum leakage current that a device is allowed depends on the requirements of the particular safety agency involved. Here, selection of the filter is quite easy since either the filter is designed to meet a given level or it is not. Although there is no compromise when it comes to safety specifications, it should be understood that for a given level of performance, as the leakage current is reduced, the physical size of the package will increase. Curtis medical filters have a very low leakage current.

## Insertion Loss

DO NOT use the insertion loss specifications to make your final decision. Power line filters are two-terminal pair passive networks whose attenuation characteristics can be defined by a complex transfer function. How that transfer function will react in a particular system and at specific frequencies will depend on the complex impedances connected to each side of the filter. The equipment impedance and the impedance of the power line, even if a 50 ohm LISN (Line Impedance Stabilization Network) is being used during emission testing, will not generally be equal to the resistive 50 ohms used during insertion loss measurements. Therefore, the performance of the filter in the equipment cannot be related to the published insertion loss data.

## Minimum Insertion Loss

Do not be alarmed that the insertion loss figures we have published may be of lower value than those of our competition. You will only find guaranteed minimum insertion loss figures in this catalog, without any mention of typical values.

Insertion loss test data measured in a 50 ohm system is a valuable incoming inspection tool to assure you that consistent product is being shipped. The only figures of any importance are those that specify the criteria for acceptance or rejection of that product, and those figures are the minimum values.

Curtis offers full RFI/EMI conducted emissions testing services for manufacturers who must produce equipment in accordance with FCC and CE standards.

Curtis testing facilities consist of a laboratory equipped to test and evaluate EMI characteristics of equipment that must comply with FCC Part 15 and/or CISPR standards. With these facilities, Curtis can provide manufacturers with greater assistance in the selection of RFI/EMI filters to help them meet the necessary emission levels.

## Isolated Environment Enhances Test Capabilities

- Totally isolated environment for both equipment under test and test instrumentation provided by separate chambers.
- RF screen room shielded against magnetic, electric and plane wave field per MIL-STD-285.
- Specially constructed line impedance stabilization networks (LISN) for FC Part 15 and CISPR testing.
- Sensitive, reliable automatic measurement and recording of conducted emissions data from 10 KHz to 1 GHz .
- Computer-controlled Agilent E7402A Spectrum Analyzer with associated amplifiers and attenuators.
- Agilent E7402A graphics capabilities allow quick generation of hard copies of emissions test results.

## WITH FILTER

## Fast Pre-Compliance Test Results

Computer-generated graphics and test reports provide the customer with fast turnaround on all testing.

On-site RFI filter design/applications engineers are available to assist in evaluating test results and to determine cost-effective solutions to conducted emissions problems before going to agencies.

Please contact your local Curtis representative or the factory sales staff to coordinate pre-compliance testing of your equipment at Curtis Industries.

The Curtis screen room provides complete RFI isolation for equipment under test and the test instrumentation.

Computer-controlled test equipment assures fast turnaround on RFI emissions testing.

Curtis can provide environmental testing to demonstrate performance and survival in harsh conditions.

## Custom Filter Capabilities we Build Confidence!

Curtis has the capability to modify any of our standard filters or to work with you from design to delivery on a completely custom filter to meet your exact mechanical and electrical requirements. The Curtis Filter Engineering Team, drawing from our extensive knowledge and experience, is fully equipped and qualified to consult with you on your RFI and EMI emission control problems. Curtis has the ability to test your equipment in our technologically advanced screen room to help you select the proper filter for your application.
