(1) Open Circuit Inductance Test Parameters: 100kHz, 0.25V, 0.0Adc.

(2) I_{rms}: DC current for an approximate ΔT of 40°C without core loss. Derating is necessary for AC currents. PCB layout, trace thickness and width, air-flow, and proximity of other heat generating components will affect the temperature rise. It is recommended that the temperature of the part not exceed 125°C under worst case operating conditions verified in the end application.

(3) I_{sat} Amperes peak for approximately 20% rolloff (@25°C)

(4) K-factor: Used to determine B p-p for core loss (see graph).
 $B_{p-p} = K \cdot L \cdot \Delta I$, B p-p: (Gauss), K: (K factor from table), L: (Inductance in µH),
 ΔI (Peak to peak ripple current in Amps).
