

TRUE DIGITAL AUDIO AMPLIFIER TAS5100A PWM POWER OUTPUT STAGE

FEATURES

- TAS5000 + TAS5100A TDAA System-High Quality Digital Audio Amplification
- 93-dB Dynamic Range (TDAA System)
- THD+N < 0.08% (1 kHz, 1 W to 30 W RMS Into 6 Ω)
- Power Efficiency > 90% Into 8-Ω Load
- Low Profile, SMD 32-Pin PowerPAD™ Package Requires No Heat-Sink When Using Recommended Layout
- 30-W RMS Continuous Power Into 4 Ω to 8 Ω
- Self-Protecting Design
- 3.3-V Digital Interface
- EMI Compliant When Used With Recommended System Design

APPLICATIONS

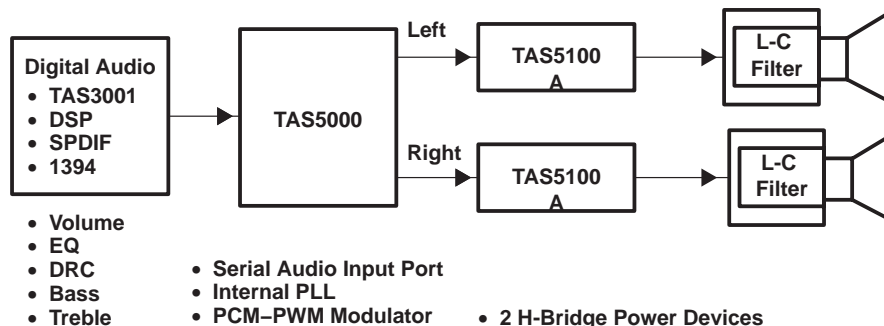

- DVD Receiver
- Home Theater
- Car Audio Amplifiers and Head Units

- Internet Music Appliance
- Mini/Micro Component Systems

DESCRIPTION

True digital audio amplifier (TDAA) is a new paradigm in digital audio. The TDAA system currently consists of the TAS5000 PCM-PWM modulator device + TAS5100A PWM power output device. This system accepts a serial PCM digital audio stream and converts it to a 3.3-V PWM audio stream (TAS5000). The TAS5100A device then provides a large-signal PWM output. This digital PWM signal is then demodulated providing power output for driving loudspeakers. This patented technology provides low-cost, high-quality, high-efficient digital audio applicable to many audio systems developed for the digital age. The TAS5100A is a single-channel PWM power audio device. It contains integrated gate drivers, four matched and electrically isolated enhancement-mode N-channel power DMOS transistors. Also, included are protection and fault-reporting circuitry. This device is optimized for use with the TAS5000 digital modulator.

TYPICAL TDAA STEREO AUDIO SYSTEM

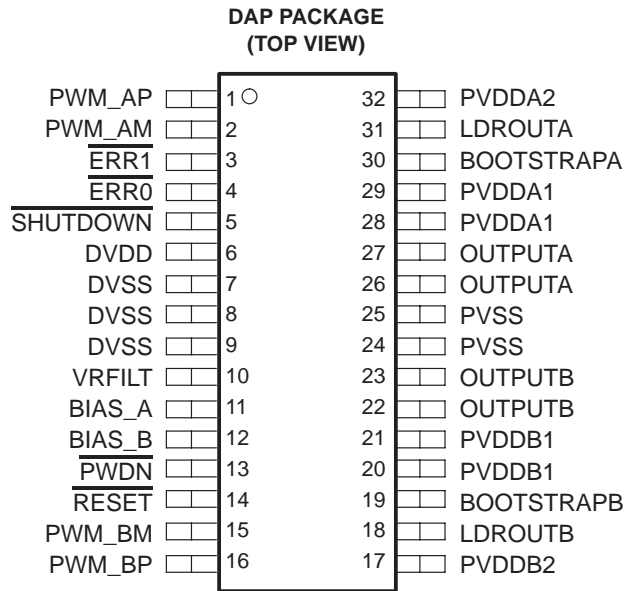

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

PowerPAD and Equibit are trademarks of Texas Instruments.

PRODUCTION DATA information is current as of publication date. Products conform to specifications per the terms of Texas Instruments standard warranty. Production processing does not necessarily include testing of all parameters.

terminal assignments

The TAS5100A is offered in a thermally enhanced 32-pin HTSSOP surface-mount package (DAP).

Terminal Functions

TERMINAL NAME	NO.	I/O	DESCRIPTION
BIAS_A	11	I	Connect external resistor to DVSS. See application note SLAA117
BIAS_B	12	I	Connect external resistor to DVSS. See application note SLAA117
BOOTSTRAPA	30	O	Bootstrap capacitor pin for H-bridge A
BOOTSTRAPB	19	O	Bootstrap capacitor pin for H-bridge B
DVDD	6	I	3.3-V digital voltage supply for logic
DVSS	7, 8, 9	I	Digital ground for logic is internally connected to PVSS. All three pins must be tied together but not connected externally to PVSS. See Figure 5.
ERR1	3	O	Error/warning report indicator. This output is open drain with internal pullup resistor.
ERR0	4	O	Error/warning report indicator. This output is open drain with internal pullup resistor.
LDROUTA	31	O	Low voltage drop-out regulator output A (not to be used to supply current to external circuitry)
LDROUTB	18	O	Low voltage drop-out regulator output B (not to be used to supply current to external circuitry)
OUTPUTA	26, 27	O	H-bridge output A
OUTPUTB	22, 23	O	H-bridge output B
PVDDA1	28, 29	I	High voltage power supply, H-bridge A
PVDDA2	32	I	High voltage power supply for low-dropout voltage regulator A-side
PVddb1	20, 21	I	High voltage power supply, H-bridge B
PVddb2	17	I	High voltage power supply for low-dropout voltage regulator B-side
PVSS	24, 25	I	High voltage power supply ground
PWDN	13	I	Power down = 0, normal mode = 1
PWM_AP	1	I	PWM input A(+)
PWM_AM	2	I	PWM input A(-)
PWM_BP	16	I	PWM input B(+)
PWM_BM	15	I	PWM input B(-)
RESET	14	I	Reset and mute mode = 0, normal mode = 1, when in reset mode, H-bridge MOSFETs are in low-low output state. Asserting the RESET signal low causes all fault conditions to be cleared.
SHUTDOWN	5	O	Device is in shutdown due to fault condition, normal mode = 1, shutdown = 0, when device is in shutdown mode the H-bridge MOSFETs are in low-low output state. The latched output can be cleared by asserting the RESET signal. This output is open drain with internal pullup resistor.
VRFILT	10	O	A filter capacitor must be added between VRFILT and DVSS pins.

NOTE: The four PWM inputs: PWM_AP, PWM_AM, PWM_BP, and PWM_BM must always be connected to the TAS5000 output pins, and never left floating. Floating PWM input pins causes an illegal PWM input state signal to be asserted.

Dual pins: OUTPUTA, OUTPUTB, PVDDA1 and PVddb1 must have both pins connected externally to the same point on the circuit board, respectively. Both PVSS pins must also be connected together externally. These multiple pins are for the high current DMOS output devices. Failure to connect all the multiple pins to the same respective node results in excessive current flow in the internal bond wires and can cause the device to fail. All electrical characteristics are specified and measured with all of the multiple pins connected to the same node, respectively.

functional description

PWM H-bridge state control

The digital interface control signals consists of PWM_AP, PWM_AM, PWM_BP, and PWM_BM. These signals are a complementary differential signal format for the A-side H-bridge and the B-side H-bridge.

bootstrapped gate drive

The TAS5100A includes two dedicated bootstrapped power supplies. A bootstrap capacitor is connected between the individual bootstrap pin and the associated output as described in the application note SLAA117. For example, a capacitor is connected between the BOOTSTRAPA pin and OUTPUTA pin, and another capacitor is connected between the BOOTSTRAPB pin and the OUTPUTB pin. The bootstrap power supply minimizes the number of high voltage power supply levels externally supplied to the system while providing a low noise supply level for driving the high-side N-channel DMOS transistors. See application note SLAA117 for details.

low-dropout voltage regulator

Two on-chip low-dropout voltage regulators (LDO) are provided to minimize the number of external power supplies needed for the system. These voltage regulators are for internal circuits only and cannot be used for external circuitry. Each LDO is dedicated to an H-bridge and its gate driver. An LDO output capacitor is connected between the individual LDO output pin and the associated output return as described in the application note SLAA117. For example, a capacitor is connected between the LDROUTA pin and PVSS pin, and another capacitor is connected between the LDROUTB pin and PVSS pin.

high-current H-bridge output stage

The positive outputs of the H-bridge are the two OUTPUTA pins. The negative outputs of the H-bridge are the two OUTPUTB pins. The logic for the input command to H-bridge outputs is described in the H-bridge output mapping section below. When the TAS5100A is in the normal mode, as seen in the H-bridge output mapping tables, the outputs are decoded from the inputs. However, the TAS5100A is immediately shut down if any of the following error conditions occur: over-current, over-temperature, low regulator output voltage, or an illegal PWM input state is applied. For these conditions, the outputs are set to the appropriate disabled state as specified in the H-bridge output mapping section, and the SHUTDOWN pin is set low.

H-bridge output mapping

The A-side H-bridge output is designed to the following truth table:

INPUTS				OUTPUTS		DESCRIPTION
RESET	PWDN	PWM_AP	PWM_AM	SHUTDOWN	OUTPUTA	
X	X	X	X	0	0 or Hi-Z [†]	Shutdown
X	0	X	X	1	Hi-Z	Powerdown
0	1	X	X	1	0	Reset
1	1	0	0	0	0	Shutdown
1	1	0	1	1	0	Normal
1	1	1	0	1	1	Normal
1	1	1	1	0	0	Shutdown

[†] Output is 0 for low voltage, over temperature, and illegal input. Hi-Z is for over current.

H-bridge output mapping (continued)

The B-side H-bridge output is designed to the following truth table:

INPUTS				OUTPUTS		DESCRIPTION
RESET	PWDN	PWM_BP	PWM_BM	SHUTDOWN	OUTPUTB	
X	X	X	X	0	0 or Hi-Z [†]	Shutdown
X	0	X	X	1	Hi-Z	Powerdown
0	1	X	X	1	0	Reset
1	1	0	0	0	0	Shutdown
1	1	0	1	1	0	Normal
1	1	1	0	1	1	Normal
1	1	1	1	0	0	Shutdown

[†] Output is 0 for low voltage, over temperature, or illegal input. Hi-Z is for over current.

control/sense circuitry

The control/sense circuitry consists of the following 3.3-V logic level pins: $\overline{\text{PWDN}}$, $\overline{\text{RESET}}$, $\overline{\text{ERR0}}$, $\overline{\text{ERR1}}$, and $\overline{\text{SHUTDOWN}}$. The active-low $\overline{\text{PWDN}}$ input pin powers down all internal circuitry and forces the H-bridge outputs to the Hi-Z state. When the $\overline{\text{PWDN}}$ pin is low, the open drain $\overline{\text{ERR0}}$, $\overline{\text{ERR1}}$, and $\overline{\text{SHUTDOWN}}$ pins are also disabled so that their outputs can be pulled high. The active-low $\overline{\text{RESET}}$ input pin forces the H-bridge outputs to the low-low state and resets the over-current shutdown latch. The $\overline{\text{PWDN}}$ pin overrides the $\overline{\text{RESET}}$ pin. The $\overline{\text{ERR0}}$, $\overline{\text{ERR1}}$, and $\overline{\text{SHUTDOWN}}$ outputs indicate the following conditions in the TAS5100A as shown in the table below. These three outputs are open-drain connections with internal pullup resistors so that wire-ORed connections can be made by the user with other external control devices. The short circuit protect error condition latches the TAS5100A in this shutdown state and force the H-bridge outputs to the Hi-Z state until the device is reset by means of the $\overline{\text{RESET}}$ pin. The illegal PWM input state, over-temperature, and low regulator voltage error conditions do not latch the device in the shutdown condition. Instead the H-bridge outputs are forced to the low-low state and the TAS5100A returns to normal operation as soon as the error condition ends. Loss of clocking PWM signal is also considered an illegal PWM input state.

SHUTDOWN	ERR1	ERR0	FUNCTION	OUTPUTA	OUTPUTB
0	0	0	Illegal PWM input state	Low	Low
0	0	1	Short circuit protect (latch)	Hi-Z	Hi-Z
0	1	0	Over temperature protect	Low	Low
0	1	1	Low regulator voltage protect	Low	Low
1	0	0	Reserved	—	—
1	0	1	Reserved	—	—
1	1	0	High temperature – warning	Normal	Normal
1	1	1	Normal operation	Normal	Normal

device operation

power sequences

system power-up/power-down sequencing

The recommended power-up/power-down sequence is shown in Figure 3. For proper operation the $\overline{\text{RESET}}$ signal should be kept LOW when both DVDD and output power (PVDDA1, PVDDA2, PVddb1, and PVddb2) are being applied. The $\overline{\text{RESET}}$ signal should remain LOW for at least 1 ms after output power is applied.

† For most applications, it is recommended that pin 13 ($\overline{\text{PWDN}}$) be connected directly to pin 6 (DVDD).

Figure 3. Power-Up/Power-Down Sequence

$\overline{\text{RESET}}$ function

The device is put into a reset condition when the (active low) $\overline{\text{RESET}}$ signal is asserted. While in the reset state, the input H-bridge control signals consisting of PWM_AP, PWM_AM, PWM_BP, and PWM_BM are ignored, and the H-bridge MOSFETs are placed in a state where OUTPUTA and OUTPUTB are both low. Asserting the $\overline{\text{RESET}}$ signal low also causes the short circuit protection latch to be reset. The $\overline{\text{RESET}}$ signal is normally connected to the VALID signal from the TAS5000.

reinitialization sequence

Proper initial conditions for this device include asserting the $\overline{\text{RESET}}$ signal until the reset operation has completed (1 ms). Additionally, when using this device with the TAS5000 controller, this function can be accomplished by asserting the reset pin on the TAS5000 during the reset sequence (see Figure 3).

audio application considerations

power supply decoupling

Power supply decoupling and layout optimization information should be obtained by following the detailed information in the application note SLAA117.

optimal power transfer for H-bridge

The TAS5100A is a power H-bridge that is designed to deliver 30 W/rms into loads of 4 Ω to 8 Ω . Rather than requiring the usual heatsink, the package is designed to deliver this wattage by careful layout as described in the application note SLAA117. Careful attention must be given to the value of the high-voltage power supply level for a given load resistance. See recommended operating conditions.

audio application considerations (continued)**reconstruction output filter**

An output reconstruction filter is required between the H-bridge outputs and the loudspeaker load. This second order low-pass filter passes the audio information to the loudspeaker, while filtering out the high frequency out-of-band information contained in the H-bridge output PWM pulses. The values of the L and C components selected are dependent on the loudspeaker load impedance. See application note SLAA117.

fault indicator usage

The TAS5100A is a self-protecting device that provides device fault reporting, including over-temperature protect, under-voltage lockout (low-regulator voltage), and short circuit protection. The short circuit protection protects against short circuits that may occur at the loudspeaker load when configured according to the application note SLAA117. The TAS5100A is not recommended for driving loads less than $4\ \Omega$, since the internal current limit protection might be activated.

An under-voltage lockout signal occurs when an insufficient voltage level is present on the LDROUTA or LDROUTB pins. During this condition gate drive levels are not sufficient for driving the power MOSFETs. Normal operation is resumed when the minimum proper LDROUTA or LDROUTB level is obtained, and the low regulator voltage protect signal is de-asserted. See the control/sense circuitry section for error and warning conditions.

A high temperature warning signal is asserted on pin $\overline{\text{ERR0}}$ when the device temperature exceeds 130°C typical.

If the internal device temperature exceeds 150°C typical, the over temperature protect signal is asserted and the TAS5100A is shut down. The device re-enables once the temperature drops to 130°C typical. See the control/sense circuitry section for error and warning conditions.

Detection of an illegal PWM input state or the loss of a clocking PWM input signal causes an illegal PWM input state signal to be asserted on the $\overline{\text{ERR1}}$ and $\overline{\text{ERR0}}$ pins and sets the $\overline{\text{SHUTDOWN}}$ pin to the low state.

absolute maximum ratings over operating free-air temperature (unless otherwise noted)†

DC supply voltage range: DVDD to DVSS	-0.3 V to 4.2 V
PWM_AP, PWM_AM, PWM_BP, PWM_BM	-0.3 V to DVDD + 0.3 V
RESET, PWDN	-0.3 V to DVDD + 0.3 V
PVDDA1 to PVSS, PVddb1 to PVSS	-0.3 V to 28 V
PVDDA2 to PVSS, PVddb2 to PVSS	-0.3 V to 27 V
Output DMOS drain-to-source breakdown voltage	28 V
Continuous DMOS RMS drain current, each output	3 A
Continuous source-to-drain RMS body diode current	3 A
Operating junction temperature range, T_J	-40°C to 150°C
Storage temperature range, T_{stg}	-65°C to 150°C
Lead temperature 1,6 mm (1/16 inch) from case for 10 seconds)	260°C

† Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

DISSIPATION DERATING TABLE

Thermal resistance junction-to-ambient, θ_{jA}		2 oz. trace and copper pad without solder			$^\circ\text{C/W}$

† One of the most influential components on the thermal performance of a package is board design. In order to take full advantage of the heat dissipating abilities of the PowerPAD packages, a board must be used that acts similar to a heat sink and allows for the use of the exposed (and solderable), deep downset pad. See Appendix A of the *PowerPAD Thermally Enhanced Package* application note, TI literature number SLMA002 and the *Thermal Design of the PowerPad PCB Layout* section of the *System Design Considerations for True Digital Audio Power Amplifiers* application note, TI literature number SLAA117.

NOTE 5: These voltage regulators are for internal gate drive circuits only and are not to be used under any circumstances to supply current to external circuitry.

THERMAL INFORMATION

The thermally enhanced DAP package is based on the 32-pin HTSSOP, but includes a thermal pad (see Figure 4) to provide an effective thermal contact between the IC and the PWB.

Traditionally, surface mount and power have been mutually exclusive terms. A variety of scaled-down TO-220 type packages have leads formed as gull wings to make them applicable for surface-mount applications. These packages, however, have two shortcomings: they do not address the low profile requirements (<2 mm) of many of today’s advanced systems, and they do not offer a terminal-count high enough to accommodate increasing integration. On the other hand, traditional low-power surface-mount packages require power-dissipation derating that severely limits the usable range of many high-performance analog circuits.

The PowerPAD package (thermally enhanced HTSSOP) combines fine-pitch surface-mount technology with thermal performance comparable to much larger power packages.

The PowerPAD package is designed to optimize the heat transfer to the PWB. Because of the very small size and limited mass of a HTSSOP package, thermal enhancement is achieved by improving the thermal conduction paths that remove heat from the component. The thermal pad is formed using a patented lead-frame design and manufacturing technique to provide a direct connection to the heat-generating IC. When this pad is soldered or otherwise thermally coupled to an external heat dissipater, high power dissipation in the ultrathin, fine-pitch, surface-mount package can be reliably achieved. See dissipation derating table.

⁽¹⁾ The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSELETE: TI has discontinued the production of the device.

⁽²⁾ Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

⁽³⁾ MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

PowerPAD™ PLASTIC SMALL-OUTLINE PACKAGE

- NOTES:
- A. All linear dimensions are in millimeters.
 - B. This drawing is subject to change without notice.
 - C. Body dimensions do not include mold flash or protrusion. Mold flash and protrusion shall not exceed 0.15 per side.
 - D. This package is designed to be soldered to a thermal pad on the board. Refer to Technical Brief, PowerPad Thermally Enhanced Package, Texas Instruments Literature No. SLMA002 for information regarding recommended board layout. This document is available at www.ti.com <<http://www.ti.com>>.
 - E. Falls within JEDEC MO-153

PowerPAD is a trademark of Texas Instruments.

THERMAL INFORMATION

This PowerPAD™ package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB). After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For information on the Quad Flatpack No-Lead (QFN) package and its advantages, refer to Application Report, Quad Flatpack No-Lead Logic Packages, Texas Instruments Literature No. SCBA017. This document is available at www.ti.com.

The exposed thermal pad dimensions for this package are shown in the following illustration.

NOTE: All linear dimensions are in millimeters

Exposed Thermal Pad Dimensions

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
