## 20W Hi-Fi AUDIO POWER AMPLIFIER

## DESCRIPTION

The TDA2040 is a monolithic integrated circuit in Pentawatt ® package, intended for use as an audio class AB amplifier. Typically it provides 22W output power ( $\mathrm{d}=0.5 \%$ ) at $\mathrm{V}_{\mathrm{s}}=32 \mathrm{~V} / 4 \Omega$. The TDA2040 provides high output current and has very low harmonic and cross-over distortion. Further the device incorporates a patented short circuit protection system comprising an arrangement for automatically limiting the dissipated power so as to keep the working point of the output transistors within their safe operating area. A thermal shut-down system is also included.

ORDERING NUMBER : TDA2040V

## mULTIWAY SPEAKER SYSTEMS AND ACTIVE BOXES

Multiway loudspeaker systems provide the best possible acoustic performance since each loudspeaker is specially designed and optimized to handle a limited range of frequencies. Commonly, these loudspeaker systems divide the audio spectrum into two, three or four bands.
To maintain a flat frequency response over the $\mathrm{Hi}-\mathrm{Fi}$ audio range the bands covered by each loudspeaker must overlap slightly. Imbalance between the loudspeakers produces unacceptable results therefore it is important to ensure that each unit generates the correct amount of acoustic energy for its segment of the audio spectrum. In this respect it is also important to know the energy distribution of the music spectrum determine the cutoff frequencies of the crossover filters (see Figure 19). As an example, a 100 W three-way system with crossover frequencies of 400 Hz and 3 kHz would require 50 W for the woofer, 35 W for the midrange unit and 15 W for the tweeter.
Both active and passive filters can be used for crossovers but today active filters cost significantly less than a good passive filter using air-cored inductors and non-electrolytic capacitors. In addition, active filters do not suffer from the typical defects of passive filters :

- power loss
- increased impedance seen by the loudspeaker (lower damping)
- difficulty of precise design due to variable loudspeaker impedance
Obviously, active crossovers can only be used if a

Figure 19 : Power Distribution versus Frequency

power amplifier is provided for each drive unit. This makes it particularly interesting and economically sound to use monolithic power amplifiers. In some applications, complex filters are not really necessary and simple RC low-pass and high-pass networks ( $6 \mathrm{~dB} / \mathrm{octave}$ ) can be recommended.
The results obtained are excellent because this is the best type of audio filter and the only one free from phase and transient distortion.
The rather poor out of band attenuation of single RC filters means that the loudspeaker must operate linearly well beyond the crossover frequency to avoid distortion.
A more effective solution, named "Active Power Filter" by SGS is shown in Figure 20.

Figure 20 : Active Power Filter

The proposed circuit can realize combined power amplifiers and $12 \mathrm{~dB} /$ octave or $18 \mathrm{~dB} /$ octave highpass or low-pass filters.
In practice, at the input pins of the amplifier two equal and in-phase voltages are available, as required for the active filter operation.

The impedance at the pin (-) is of the order of $100 \Omega$, while that of the pin $(+)$ is very high, which is also what was wanted.

| $\mathbf{C 1}=\mathbf{C 2}=\mathbf{C 3}$ | $\mathbf{R 1}$ | R2 | R3 |
| :---: | :---: | :---: | :---: |
| 22 nF | $8.2 \mathrm{k} \Omega$ | $5.6 \mathrm{k} \Omega$ | $33 \mathrm{k} \Omega$ |

The component values calculated for $\mathrm{f}_{\mathrm{c}}=900 \mathrm{~Hz}$ using a Bessel 3rd order Sallen and Key structure are:
In the block diagram of Figure 21 is represented an active loudspeaker system completely realized using power integrated circuit, rather than the traditional discrete transistors on hybrids, very high quality is obtained by driving the audio spectrum into three bands using active crossovers (TDA2320A) and a separate amplifier and loudspeakers for each band.
A modern subwoofer/midrange/tweeter solution is used.

## PRATICAL CONSIDERATION

## Printed Circuit Board

The layout shown in Figure 11 should be adopted by the designers. If different layouts are used, the ground points of input 1 and input 2 must be well decoupled from the gorund return of the output in which a high current flows.

## Assembly Suggestion

No electrical isolation is needed between the package and the heatsink with single supply voltage configuration.

## Application Suggestions

The recommended values of the components are those shown on application circuit of Fig. 10. Different values can be used. The following table can help the designer.

Figure 21 : High Power Active Loudspeaker System using TDA2030A and TDA2040

| Comp. | Recom. <br> Value | Purpose | Larger than <br> Recommended Value | Smaller than <br> Recommended Value |
| :---: | :---: | :--- | :--- | :--- |
| R1 | $22 \mathrm{k} \Omega$ | Non inverting input biasing | Increase of input impedance | Decrease of input impedance |
| R2 | $680 \Omega$ | Closed loop gain setting | Decrease of gain (*) | Increase of gain |
| R3 | $22 \mathrm{k} \Omega$ | Closed loop gain setting | Increase of gain | Decrease of gain (*) |
| R4 | $4.7 \Omega$ | Frequency stability | Danger of oscillation at high <br> frequencies with inductive loads |  |
| C1 | $1 \mu \mathrm{~F}$ | Input DC decoupling |  | Increase of low frequencies cut-off |
| C 2 | $22 \mu \mathrm{~F}$ | Inverting DC decoupling |  | Increase of low frequencies cut-off |
| $\mathrm{C} 3, \mathrm{C} 4$ | $0.1 \mu \mathrm{~F}$ | Supply voltage bypass |  | Danger of oscillation |
| $\mathrm{C} 5, \mathrm{C} 6$ | $220 \mu \mathrm{~F}$ | Supply voltage bypass |  | Danger of oscillation |
| C 7 | $0.1 \mu \mathrm{~F}$ | Frequency stability |  | Danger of oscillation |

$\left(^{*}\right)$ The value of closed loop gain must be higher than 24 dB
