# TS2007

## 3W filter-free Class D audio power amplifer with 6-12dB fixed gain select

## Features

- Operating range from $V_{CC}$=2.4V to 5.5V
- Standby mode active low
- Output power: 1.4W @5V or 0.45W @ 3.0V into 8Ω with 1% THD+N max.
- Output power: 2.3W @5V or 0.75W @ 3.0V into 4Ω with 1% THD+N max.
- Fixed gain select: 6dB or 12dB
- Low current consumption
- Efficiency: 88% typ.
- Signal-to-noise ratio: 94dB typ.
- PSRR: 63dB typ @ 217Hz with 6dB gain.
- PWM base frequency: 280kHz
- Low pop & click noise
- Thermal shutdown protection
- DFN8 3x3mm package

## Applications

- Cellular phone
- PDA
- Notebook PC

## Description

The TS2007 is a class D power audio amplifier. Able to drive up to 1.4W into an 8 Ω load at 5V, it achieves outstanding efficiency compared to typical class AB audio power amplifier.

This device allows to switch between two different gains: 6 or 12dB via a logic signal on the GS pin. A pop & click reduction circuitry provides low on/off switch noise while allowing the device to start within 5ms. A standby function (active low) allows to lower the current consumption down to 10nA typ.

**TS2007IQT - DFN8**

**TS2007IQT - DFN8**

| Pin | Name |
|-----|------|
| 1 | STBY |
| 2 | GS |
| 3 | IN+ |
| 4 | IN- |
| 8 | OUT+ |
| 7 | GND |
| 6 | VCC |
| 5 | OUT- |

The TS2007 is available in DFN8 3x3mm lead-free packages.

# Contents

# 1     Absolute maximum ratings and operating conditions

**Table 1.      Absolute maximum ratings**

| Symbol | Parameter | Value | Unit |
|--------|-----------|-------|------|
| $V_{CC}$ | Supply voltage [1] | 6 | V |
| $V_i$ | Input voltage [2] | GND to $V_{CC}$ | V |
| $T_{oper}$ | Operating free air temperature range | -40 to + 85 | °C |
| $T_{stg}$ | Storage temperature | -65 to +150 | °C |
| $T_j$ | Maximum junction temperature | 150 | °C |
| $R_{thja}$ | Thermal resistance junction to ambient [3] | 200 | °C/W |
| Pd | Power dissipation | Internally limited[4] | |
| ESD | HBM: human body model | 2 | kV |
| ESD | MM: machine model | 200 | V |
| Latch-up | Latch-up immunity | Class A | |
| | Lead temperature (soldering, 10sec) | 260 | °C |

1. All voltage values are measured with respect to the ground pin.

2. The magnitude of the input signal must never exceed $V_{CC}$ + 0.3V / GND - 0.3V.

3. The device is protected in case of over temperature by a thermal shutdown active @ 150°C.

4. Exceeding the power derating curves during a long period will cause abnormal operation.

**Table 2.      Operating conditions**

| Symbol | Parameter | Value | Unit |
|--------|-----------|-------|------|
| $V_{CC}$ | Supply voltage | 2.4 to 5.5 | V |
| $V_I$ | Input voltage range | GND to $V_{CC}$ | V |
| $V_{ic}$ | Input common mode voltage[1] | GND+0.15V to $V_{CC}$-0.7V | V |
| $V_{STBY}$ | Standby voltage input [2]<br>Device ON<br>Device OFF | $1.4 \leq V_{STBY} \leq V_{CC}$<br>$GND \leq V_{STBY} \leq 0.4$ [3] | V |
| GS | Gain select input:<br>Gain =12dB<br>Gain = 6dB | $GND \leq V_{GS} \leq 0.4$<br>$1.4 \leq V_{GS} \leq V_{CC}$ | V |
| $R_L$ | Load resistor | $\geq 4$ | Ω |
| $R_{thja}$ | Thermal resistance junction to ambient [4] | 40 | °C/W |

1. $| V_{oo} | \leq 35mV$ max with both differential gains.

2. Without any signal on $V_{STBY}$, the device is in standby (internal 300kΩ pull down resistor).

3. Minimum current consumption is obtained when $V_{STBY}$ = GND.

4. When mounted on 4-layer PCB.

# 2 Typical application

**Figure 1. Typical application schematics**

**Table 3. External component descriptions**

| Components | Functional description |
|---|---|
| $C_S$ | Supply capacitor that provides power supply filtering. |
| $C_{in}$ | Input coupling capacitors (optional) that block the DC voltage at the amplifier input terminal. The capacitors also form a high pass filter with $Z_{in}$ ($F_{cl} = 1 / (2 \times Pi \times Z_{in} \times C_{in})$). |

**Table 4.**     **Pin descriptions**

| Pin number | Pin name | Pin description |
|:---:|:---:|:---|
| 1 | STBY | Standby pin ( active low ) |
| 2 | GS | Gain select input |
| 3 | IN+ | Positive differential input |
| 4 | IN- | Negative differential input |
| 5 | OUT- | Negative differential output |
| 6 | VCC | Power supply |
| 7 | GND | Ground |
| 8 | OUT+ | Positive differential output |

# 3 Electrical characteristics

3. Independent of Gain configuration (6 or 12dB) and between IN+ or IN- and GND.

## 3.2 Electrical characteristic curves

The graphs shown in this section use the following abbreviations:

- $R_L$+ 15µH or 30µH = pure resistor + very low series resistance inductor
- Filter = LC output filter (1µF+30µH for 4Ω and 0.5µF+60µH for 8Ω)

All measurements are done with $C_{S1}$=1µF and $C_{S2}$=100nF (see *Figure 2*, except for the PSRR where $C_{S1}$ is removed (see *Figure 3*).

# 4 Application information

## 4.1 Differential configuration principle

The TS2007 is a monolithic fully-differential input/output class D power amplifier. The TS2007 also includes a common-mode feedback loop that controls the output bias value to average it at $V_{CC}/2$ for any DC common mode input voltage. This allows the device to always have a maximum output voltage swing, and by consequence, maximize the output power. Moreover, as the load is connected differentially compared to a single-ended topology, the output is four times higher for the same power supply voltage.

The **advantages** of a full-differential amplifier are:

● High PSRR (power supply rejection ratio)

● High common mode noise rejection

● Virtually zero pop without additional circuitry, giving a faster start-up time compared to conventional single-ended input amplifiers

● Easier interfacing with differential output audio DAC

● No input coupling capacitors required thanks to common mode feedback loop

## 4.2 Gain settings

In the flat region of the frequency-response curve (no input coupling capacitor or internal feedback loop + load effect), the differential gain can be set to either 6 or 12 dB depending on the logic level of the GS pin:

| GS | Gain (dB) | Gain (V/V) |
|---|---|---|
| 1 | 6dB | 2 |
| 0 | 12dB | 4 |

*Note:* *Between the GS pin and $V_{CC}$ there is an internal 300k$\Omega$ resistor. When the pin is floating the gain is 6 dB.*

## 4.3 Common mode feedback loop limitations

As explained previously, the common mode feedback loop allows the output DC bias voltage to be averaged at $V_{CC}/2$ for any DC common mode bias input voltage.

Due to the $V_{ic}$ limitation of the input stage (see *Table 2: Operating conditions on page 3*), the common mode feedback loop can fulfil its role only within the defined range.

## 4.4 Low frequency response

If a low frequency bandwidth limitation is required, it is possible to use input coupling capacitors. In the low frequency region, the input coupling capacitor $C_{in}$ starts to have an effect. $C_{in}$ forms, with the input impedance $Z_{in}$, a first order high-pass filter with a -3dB cut-off frequency (see *Table 5* to *Table 9*).

$$F_{CL} = \frac{1}{2 \cdot \pi \cdot Z_{in} \cdot C_{in}}$$

So, for a desired cut-off frequency $F_{CL}$ we can calculate $C_{in}$:

$$C_{in} = \frac{1}{2 \cdot \pi \cdot Z_{in} \cdot F_{CL}}$$

with $F_{CL}$ in Hz, $Z_{in}$ in $\Omega$ and $C_{in}$ in F.

The input impedance $Z_{in}$ is for the whole power supply voltage range, typically 75k$\Omega$. There is also a tolerance around the typical value (see *Table 5* to *Table 9*). With regard to the tolerance, you can also calculate tolerance of the $F_{CL}$:

- $F_{CLmax} = 1.103 \cdot F_{CL}$

- $F_{CLmin} = 0.915 \cdot F_{CL}$

## 4.5    Decoupling of the circuit

A power supply capacitor, referred to as $C_{S,}$ is needed to correctly bypass the TS2007.

The TS2007 has a typical switching frequency of 280kHz and output fall and rise time about 5ns. Due to these very fast transients, careful decoupling is mandatory.

A 1µF ceramic capacitor is enough, but it must be located very close to the TS2007 in order to avoid any extra parasitic inductance created by a long track wire. Parasitic loop inductance, in relation with di/dt, introduces overvoltage that decreases the global efficiency of the device and may cause, if this parasitic inductance is too high, a TS2007 breakdown.

In addition, even if a ceramic capacitor has an adequate high frequency ESR value, its current capability is also important. A 0603 size is a good compromise, particularly when a 4$\Omega$ load is used.

Another important parameter is the rated voltage of the capacitor. A 1µF/6.3V capacitor used at 5V, loses about 50% of its value. With a power supply voltage of 5V, the decoupling value, instead of 1µF, could be reduced to 0.5µF. As $C_S$ has particular influence on the THD+N in the medium to high frequency region, this capacitor variation becomes decisive. In addition, less decoupling means higher overshoots which can be problematic if they reach the power supply AMR value (6V).

## 4.6    Wake-up time (t$_{wu}$)

When the standby is released to set the device ON, there is a wait of 5ms typically. The TS2007 has an internal digital delay that mutes the outputs and releases them after this time in order to avoid any pop noise.

*Note:*      *The gain increases smoothly (see Figure 49) from the mute to the gain selected by the GS pin (Section 4.2).*

## 4.7 Shutdown time

When the standby command is set, the time required to put the two output stages into high impedance and to put the internal circuitry in shutdown mode, is typically 5ms. This time is used to decrease the gain and avoid any pop noise during shutdown.

*Note:*  *The gain decreases smoothly until the outputs are muted (see Figure 49).*

## 4.8 Consumption in shutdown mode

Between the shutdown pin and GND there is an internal 300kΩ resistor. This resistor forces the TS2007 to be in shutdown when the shutdown input is left floating.

However, this resistor also introduces additional shutdown power consumption if the shutdown pin voltage is not 0V.

Referring to *Table 2: Operating conditions on page 3*, with a 0.4V shutdown voltage pin for example, you must add 0.4V/300k=1.3µA in typical (0.4V/273k=1.46µA in maximum) to the shutdown current specified in *Table 5* to *Table 9*.

## 4.9 Single-ended input configuration

It is possible to use the TS2007 in a single-ended input configuration. However, input coupling capacitors are needed in this configuration. The following schematic diagram shows a typical single-ended input application.

**Figure 50.   Typical application for single-ended input configuration**
## 4.10    Output filter considerations

The TS2007 is designed to operate without an output filter. However, due to very sharp transients on the TS2007 output, EMI radiated emissions may cause some standard compliance issues.

These EMI standard compliance issues can appear if the distance between the TS2007 outputs and loudspeaker terminal are long (typically more than 50mm, or 100mm in both directions, to the speaker terminals). As the PCB layout and internal equipment device are different for each configuration, it is difficult to provide a one-size-fits-all solution.

However, to decrease the probability of EMI issues, there are several simple rules to follow:

● Reduce, as much as possible, the distance between the TS2007 output pins and the speaker terminals.

● Use a ground plane for "shielding" sensitive wires.

● Place, as close as possible to the TS2007 and in series with each output, a ferrite bead with a rated current of minimum 2.5A and impedance greater than 50Ω at frequencies above 30MHz. If, after testing, these ferrite beads are not necessary, replace them by a short-circuit.

● Allow extra footprint to place, if necessary, a capacitor to short perturbations to ground (see *Figure 51*).
**Figure 51.   Ferrite chip bead placement**

In the case where the distance between the TS2007 output and the speaker terminals is too long, it is possible to have low frequency EMI issues due to the fact that the typical operating frequency is 280kHz. In this configuration, it is necessary to use the output filter represented in *Figure 1 on page 4* as close as possible to the TS2007.

# 5 Package information

In order to meet environmental requirements, STMicroelectronics offers these devices in ECOPACK® packages. These packages have a lead-free second level interconnect. The category of second level interconnect is marked on the package and on the inner box label, in compliance with JEDEC Standard JESD97. The maximum ratings related to soldering conditions are also marked on the inner box label. ECOPACK is an STMicroelectronics trademark. ECOPACK specifications are available at: www.st.com.
