Structure	Silicon Monolithic Bipolar IC
Appearance	SIL-12 Pins Plastic Package (FP-12S Power Type With Fin)
Application	Audio
Function	70W (6Ω) x 1ch BTL Power Amplifier Built-in Standby and Muting Features Incorporating Various Protection Circuits

A	Absolute Maximum Ratings				
No.	Item	Symbol	Ratings	Unit	Note
1	Storage Temperature	Tstg	-55 ~ +150	° C	
2	Operating Ambient Temperature	Topr	-25 ~ +75	° C	
3	Operating Ambient Pressure	Popr	1.013x10 ⁵ ±0.61x10 ⁵	Pa	
4	Operating Constant Acceleration	Gopr	9,810	m / s ²	
5	Operating Shock	Sopr	4,900	m / s ²	
6	Power Supply Voltage	Vcc	33	V	1
7	Power Supply Current	Icc	8.0	A	
8	Power Dissipation	PD	37.5	W	2

Operating Supply Voltage Range	Vcc	10 V ~ 32V
--------------------------------	-----	------------

Note: 1) Without input signal, Vcc is up to 33V
2) Ta = 75°C with infinite heatsink

Power dissipation and Heat Sink

Definition of terms

- PD: Power Dissipation
- Tj: Junction Temperature
- TC: Case Temperature
- TA: Ambient Temperature
- θJC: Thermal Resistance of junction to case
- θCA: Thermal Resistance of case to ambient, normally through heat sink

FIG1. Simplified Illustration of IC and Heat Sink attached

The following two equations represent the relations of these terms.

$$(T_j - T_c) / \theta_{JC} = P_D \quad (1)$$

$$(T_c - T_A) / \theta_{CA} = P_D' \quad (2)$$

For reliable and long-term, continuous operation, junction temperature should not exceed 125°C and θJC for FP-12S package is 2°C/W. Substitute these values in Equation 1. After specify the PD, Tc can be determined.

Assume no heat loss at the casing, i.e. all power is dissipated to the ambient through heat sink, which is quite true. So PD = PD'. Since Tc is also known, one can determine the following using equation2:

- a) The rating of heat sink for specific maximum operating ambient temperature, or
- b) The maximum operating ambient temperature for specific heat sink rating.

A more general equation can be used for rough calculation.

$$(T_J - T_A) / \theta_{JA} = P_D \quad (3)$$

$$\theta_{JA} = \theta_{CA} + \theta_{JC} \quad (4)$$

In this case, θJA is total thermal resistance of the heat sink and IC package. Therefore, for specified power dissipation, either heat sink rating or maximum operating ambient temperature can be decided if the other is known.

Take note that it's essential to know PD value before hand in order to work out other quantities. PD calculation is as shown.

$$P_D = V_{CC} \times I_{CC} - P_{o_total} \quad (5)$$

- Vcc: DC supply voltage
- Icc: RMS value of IC current
- Po_total: Total output power

FIG2. Input DC Biasing

Input DC biasing

Input DC bias is maintained at ground level. If the input signal contains DC bias voltage, AC coupling should be included on the application circuit.

The value of 20kΩ resistor is set in order to achieve the minimum output DC offset.

Output Zobel Network

It should be noted that this device is designed such that the Zobel network (RC pair) at the output pins is not necessary for stable operation.

In practical application, the Zobel network may be applied optionally for two reasons:

- a) Ensuring stability for different PCB layout and speaker types.
- b) Ability to withstand to high ESD levels.

FIG3. Output Zobel Network

Standby operation

FIG4. Standby Application circuit

Standby pin should be connected with carefully selected components in order to avoid “Pop Noise” during Standby ON/OFF transient.

The 51k resistor and 10uF capacitor pair can delay the rising of voltage at pin 5 to reach the Standby threshold. When Standby is switching on together with supply, this delay would be very useful to ensure no “Pop Noise”.

If the Standby voltage is provided by a microcontroller, the suppression of “Pop” could even be better.

For further details of timing and delay for standby circuit, please refer to page 11.

Mute operation

Mute pin should be connected with carefully selected components in order to avoid “Pop Noise” during MUTE ON/OFF transient.

The 8.2k resistor and 33uF capacitor pair can delay the rising of voltage at pin 6 to reach the Mute threshold. When Mute is switching on together with supply, this delay would be very useful to ensure no “Pop Noise”.

FIG5. Mute application circuit

For further details of timing and delay for Mute application circuit, please refer to page 11.

(Precaution for use)

- 1) Ground the radiation fin so that there will be no difference in electric potential between the radiation fin and ground.
- 2) The thermal protection circuit operates at T_j at approximately 150°C. Thermal protection circuit is reset automatically when the temperature drops.
- 3) Be sure to attach heatsink to the IC before use. Make sure that the heatsink is secured to the chassis.
- 4) In order to prevent IC from being damaged during the fault test, prior to standby switching from on to off or vice versa, it is important to assert the mute on. Please refer to the timing diagram on page 11.
