

DUAL LOW VOLTAGE POWER AMPLIFIER

■ GENERAL DESCRIPTION

The NJM2076 is a dual power amplifier, which operates with 1.0V minimum supply voltage. The NJM2076 is suitable to small radio and head-phone of stereo and single BTL application.

■ FEATURES

- BTL operation Po=90mW type.
- Minimum external components
- Headphone stereo Amp. with external transistors

Low Operation Voltage

(1.0V MIN.)

Low Operating Current

(4.7mA TYP.)

Package Outline

DIP8, DMP8

PIN FUNCTION

- 1. Inverting Amp. Input (A)
- 2. Non-Inverting Amp. Input(B)
- 3. V+
- 4. Base(B)
- 5. (B) Output
- 6. GND
- 7. (A) Output
- 8. Base (A)

■ TYPICAL APPLICATION

1. For Stereo Head-Phone

2. BTL Amp. for Speaker

■ NOTICE

(1) External PNP Transistor

Maximum output power becomes large with low saturation voltage transistor, and so select transistor of low saturation. Saturation Voltage: less than 0.1V (Ic=100mA. $I_B=10mA$). h_{FE} : 120

(2) External Frequency Compensation

Recommend tantalum capacitor with low tan δ (less than 0.25 at f=10kHz) and 1 Ω resistor. Stable with large capacitor of less high frequency distortion and worse tan δ . For example: $1\mu F$, tan $\delta \le 0.6$

(3) Layout on PCB

Be careful to get maximum output power and low distortion set.

DIP/DMP: Signal ground has to be close to IC ground pin. Impedance of ground line must be low.
