

## CLASS D HEADPHONE AMPLIFIER FOR DIGITAL AUDIO

### ■ GENERAL DESCRIPTION

The **NJU8721** is a class D Headphone Amplifier featuring 6<sup>th</sup>  $\Delta\Sigma$  modulation. It includes Digital Attenuator, Mute, and De-emphasis circuits. It converts digital source input to PWM signal output which is converted to analog signal with simple external LC low-pass filter. The **NJU8721** realizes very high power-efficiency by class D operation. Therefore, it is suitable for portable audio set and others.

### ■ PACKAGE OUTLINE

NJU8721V

NJU8721KN1

### ■ FEATURES

- Stereo Headphone Power Amplifier : 50mW+50mW
- Sixth-order 32f<sub>s</sub> Over Sampling  $\Delta\Sigma$  & PWM
- Internal 8f<sub>s</sub> Over Sampling Digital Filter
- Sampling Frequency : 96kHz (Max.)
- De-Emphasis : 32kHz, 44.1kHz, 48kHz
- System Clock : 256f<sub>s</sub>
- Digital Processing : Attenuator 107step, LOG Curve : Mute
- Digital Audio Interface : 16bit, 18bit : I<sup>2</sup>S, LSB Justified, MSB Justified
- Operating Voltage : 2.4 to 3.6V
- Driving Voltage : V<sub>DD</sub> to 5.25V
- C-MOS Technology
- Package Outline : SSOP20 / QFN28

## ■ INPUT TERMINAL STRUCTURE

## FUNCTIONAL DESCRIPTION

### (1) Signal Output

PWM signals of L channel and R output from  $OUT_L$  and  $OUT_R$  terminals respectively. These signals are converted to analog signal by external 2nd-order or over LC filter. The output driver power supplied from  $V_{DDL}$ ,  $V_{DDR}$ ,  $V_{SSL}$ , and  $V_{SSR}$  are required high response power supply against voltage fluctuation like as switching regulator because Output THD is effected by power supply stability.

### (2) Master Clock

Master Clock is  $256f_s$  clock into MCK terminal for the internal circuit operation clock.

### (3) Reset

"L" level input over than 3ms to the RST terminal is initialization signal to initialize the internal circuit. This initialization signal is synchronized with internal clock and executes logical OR with the internal power on reset signal. This Reset signal initializes the internal function setting registers also. During initialization, output terminals of  $OUT_L$  and  $OUT_R$  are high-impedance.

Figure 1. Reset Timing

### (4) $8f_s$ Over Sampling Digital Filter

$8f_s$  Over Sampling Digital Filter interpolates Audio data and decreases aliasing noise. It realizes Attenuation and De-Emphasis function by serial function control.

### (5) $32f_s$ $6^{th}$ $\Delta\Sigma$ & PWM

$32f_s$   $6^{th}$   $\Delta\Sigma$  & PWM convert from Audio data of the  $8f_s$  Over Sampling Digital Filter to the  $32f_s$  one bit PWM data.

## (6) System Control

### (6-1) Standby

Standby functions by "L" level input to the STBY terminal. In busy of Standby, conditions of digital audio format set, attenuation level, de-emphasis, and attenuator operation time are kept and output terminals of  $OUT_L$  and  $OUT_R$  are high-impedance.

### (6-2) Control Mode Set

A control mode as shown below is selected by the MODE terminal.

MODE	Control Method	Function	Terminals
0	Parallel	Digital Audio interface Format Set	F0, F1, F2
1	Serial	Control Register serial data input	DATA, REQ, SCK

Parallel : Digital Audio Interface Format is set directly by using F0, F1, and F2 terminals.

Serial : **NJU8721** is controlled serial input data by 3-wire serial interface using DATA, REQ, and SCK terminals

By this setting, the function of F0/DATA, F1/REQ, and F2/SCK are changed.

Refer to 「(8-5)F0,F1,F2」 about function of F0, F1, and F2 terminals.

Refer to 「(8)Control Register」 about function of DATA, REQ, and SCK terminals.

### (6-3) Mute

Mute functions by "L" signal into the MUTE terminal. In busy of mute, a current attenuation value becomes  $-\infty$  by internal digital attenuator. And MUTE is stopped by "H" signal into the MUTE terminal, the attenuation value returns from  $-\infty$  to previous value.

MUTE	Attenuation Level
0	$-\infty$
1	Set Value

Figure 2. Mute Timing

## (7) Serial Audio Data Interface

### (7-1) Input Data Format Selection

The digital audio interface format is selected out of I<sup>2</sup>S, MSB Justified or LSB Justified, and 16 bits or 18 bits data length.

### (7-2) Input Timing

Digital audio signal data into DIN terminal is fetched into the internal shift register by BCK signal rising edge. The fetched data in the shift register are transferred by rising edge or falling edge of LRCK as shown below:

Data Format	Rising Edge	Falling Edge
I <sup>2</sup> S	Lch Input Register	Rch Input Register
MSB Justified	Rch Input Register	Lch Input Register
LSB Justified	Rch Input Register	Lch Input Register

BCK and LRCK must be synchronized with MCK.

Figure 3.4. 18 bits I<sup>2</sup>S Data Format

Figure 3.5. 18 bits MSB Justified Data Format

Figure 3.6. 18 bits LSB Justified Data Format

(7-3) Failure of Synchronization Operation

If the MCK clock fluctuates over than  $\pm 10$  clocks against the LRCK and failure of synchronization is detected the attenuation value is set to  $-\infty$ . When the LRCK synchronizes with MCK again, the attenuation value returns from  $-\infty$  to previous level.

Figure 4. Out of Synchronization Operation

## (8) Control Register

When Control Mode is set to Serial control by the Mode terminal, the control register sets various modes. The Control Data is fetched by the rising edge of F2/SCK and is set into the control register by the rising edge of F1/REQ. The latest 8 bits data are valid before the F1/REQ rising pulse.

1	1	1	1	0	0	0	TRST

Do not set other data excepting this table.

### (8-2) ATTN6 to ATTN0

When B7 is "0", B0 to B6 set the attenuation data. When attenuation data is set, the attenuation value is changed to the target value in the period of transition time set by MUTT0 to MUTT2. The attenuation value (ATT) is fixed by following formula.

When ATT is 14h or less, the attenuator is set  $-\infty$  at reset. (When Control Mode is Parallel Control, ATT is fixed 0db.)

$$ATT = DATA - 121[\text{dB}]$$

DATA : attenuation point

$$7Fh = 6\text{dB}$$

$$7Eh = 5\text{dB}$$

$$7Dh = 4\text{dB}$$

⋮

$$79h = 0\text{dB}$$

⋮

$$16h = -99\text{dB}$$

$$15h = -100\text{dB}$$

$$14h = -\infty$$

$$13h = -\infty$$

⋮

$$00h = -\infty \text{ (initial value)}$$

(8-3) DEMP0, DEMP1

DEMP0 and DEMP1 control De-Emphasis on/off and sampling frequency.

DEMP1	DEMP0	De-Emphasis	Initial Value
0	0	OFF	✓
0	1	32kHz	
1	0	44.1kHz	
1	1	48kHz	

(8-4) MUTE

Mute operation is controlled by the "MUTE" as same as the MUTE terminal control.

MUTE	Mute Operation	Initial Value
0	OFF	✓
1	ON	

(8-5) F0, F1, F2

F0, F1, and F2 select Digital Audio Interface Format. As same as the F0/DATA, F1/REQ, and F2/SCK terminal control.

F0	F1	F2	Interface Format	Bit Length	Initial Value
0	0	0	I <sup>2</sup> S	16	✓
0	0	1	MSB Justified	16	
0	1	0	LSB Justified	16	
1	0	0	I <sup>2</sup> S	18	
1	0	1	MSB Justified	18	
1	1	0	LSB Justified	18	

(8-6) RST

When the RST is "1", the control register and inner data (Digital filter, PWM modulator) are initialized.

RST	Reset Operation	Initial Value
0	OFF	✓
1	ON	

(8-7) TRST

When the TRST is "1", only inner data (Digital filter, PWM modulator) is initialized.

TRST	Data Bus Initialize	Initial Value
0	OFF	✓
1	ON	

(8-8) MUTT2 to MUTT0

MUTT2 to MUTT0 set the attenuator transition time. This transition time is one attenuation step change time.

MUTT2	MUTT1	MUTT0	Operation Time	Initial Value
0	0	0	1 / f <sub>s</sub>	✓
0	0	1	2 / f <sub>s</sub>	
0	1	0	4 / f <sub>s</sub>	
0	1	1	8 / f <sub>s</sub>	
1	0	0	16 / f <sub>s</sub>	
1	0	1	32 / f <sub>s</sub>	
1	1	0	64 / f <sub>s</sub>	
1	1	1	128 / f <sub>s</sub>

Note 1) All voltage values are specified as V<sub>SS</sub>=V<sub>SSR</sub>=V<sub>SSL</sub>=0V.

Note 2) If the LSI is used on condition beyond the absolute maximum rating, the LSI may be destroyed. Using LSI within electrical characteristics is strongly recommended for normal operation. Use beyond the electrical characteristics conditions will cause malfunction and poor reliability.

Note 3) Decoupling capacitors should be connected between V<sub>DD</sub>-V<sub>SS</sub>, V<sub>DDR</sub>-V<sub>SSR</sub> and V<sub>DDL</sub>-V<sub>SSL</sub> due to the stabilized operation.

## APPLICATION CIRCUIT

- Note 9) De-coupling capacitors must be connected between each power supply pin and GND pin.
- Note 10) The power supply for V<sub>DDL</sub> and V<sub>DDR</sub> require fast driving response performance such as a switching regulator for THD.
- Note 11) The bigger capacitor value of AC-coupling capacitors for headphone outputs realize better frequency response characteristics, especially low frequency area.
- Note 12) The above circuit shows only application example and does not guarantee the any electrical characteristics. Therefore, please consider and check the circuit carefully to fit your application.
