
Low power quad operational amplifier

Features

- Wide gain bandwidth: 1.3MHz
- Input common-mode voltage range includes negative rail
- Large voltage gain: 100dB
- Very low supply current per amp: 375 μ A
- Low input bias current: 20nA
- Low input offset current: 2nA
- Wide power supply range:
 - Single supply: +3V to +30V
 - Dual supplies: \pm 1.5V to \pm 15V

Description

This circuit consists of four independent, high gain, internally frequency compensated operational amplifiers designed especially for automotive and industrial control systems.

It operates from a single power supply over a wide range of voltages. Operation from split power supplies is also possible and the low power supply current drain is independent of the magnitude of the power supply voltage.

- All voltage values, except differential voltage are with respect to network ground terminal.
- Differential voltages are the non-inverting input terminal with respect to the inverting input terminal.
- Short-circuit from the output to V_{CC}^+ can cause excessive heating and eventual destruction. The maximum output current is approximately 20mA, independent of the magnitude of V_{CC}^+ .
- This input current only exists when the voltage at any of the input leads is driven negative. It is due to the collector-base junction of the input PNP transistor becoming forward biased and thereby acting as input diodes clamps. In addition to this diode action, there is also NPN parasitic action on the IC chip. This transistor action can cause the output voltages of the op-amps to go to the V_{CC} voltage level (or to ground for a large overdrive) for the time duration than an input is driven negative. This is not destructive and normal output will set up again for input voltage higher than -0.3V.
- $R_{thja/c}$ are typical values.
- Human body model: A 100pF capacitor is charged to the specified voltage, then discharged through a 1.5kΩ resistor between two pins of the device. This is done for all couples of connected pin combinations while the other pins are floating.
- Machine model: A 200pF capacitor is charged to the specified voltage, then discharged directly between two pins of the device with no external series resistor (internal resistor < 5Ω). This is done for all couples of connected pin combinations while the other pins are floating.
- Charged device model: all pins and the package are charged together to the specified voltage and then discharged directly to the ground through only one pin. This is done for all pins.

Table 3. $V_{CC}^+ = 5V$, $V_{CC}^- = \text{Ground}$, $V_o = 1.4V$, $T_{amb} = 25^\circ C$ (unless otherwise specified)

Symbol	Parameter	Min.	Typ.	Max.	Unit
GBP	Gain bandwidth product $V_{CC}^+ = 30V$, $V_{in} = 10mV$, $R_L = 2k\Omega$, $C_L = 100pF$		1.3		MHz
THD	Total harmonic distortion $f = 1kHz$, $A_V = 20dB$, $R_L = 2k\Omega$, $V_o = 2V_{pp}$, $C_L = 100pF$, $V_{CC}^+ = 30V$		0.015		%
e_n	Equivalent input noise voltage $f = 1kHz$, $R_S = 100\Omega$, $V_{CC}^+ = 30V$		40		$\frac{nV}{\sqrt{Hz}}$
V_{O1}/V_{O2}	Channel separation ⁽³⁾ $1kHz \leq f \leq 20kHz$		120		dB

- $V_o = 1.4V$, $R_S = 0\Omega$, $5V < V_{CC}^+ < 30V$, $0V < V_{ic} < V_{CC}^+ - 1.5V$.
- The direction of the input current is out of the IC. This current is essentially constant, independent of the state of the output, so there is no change in the loading charge on the input lines.
- Due to the proximity of external components ensure stray capacitance does not cause coupling between these external parts. This typically can be detected as this type of capacitance increases at higher frequencies.

6 Package information

In order to meet environmental requirements, ST offers these devices in ECOPACK® packages. These packages have a lead-free second level interconnect. The category of second level interconnect is marked on the package and on the inner box label, in compliance with JEDEC Standard JESD97. The maximum ratings related to soldering conditions are also marked on the inner box label. ECOPACK is an ST trademark. ECOPACK specifications are available at: www.st.com.

8 Revision history

Date	Revision	Changes
30-Nov-2001	1	Initial release.
1-Jul-2005	2	PPAP references inserted in the datasheet, see Table 7: Order codes . ESD protection inserted in Table 1 on page 3 .
31-Oct-2005	3	An error in the device description was corrected on page 1. PPAP reference inserted in the datasheet see Table 7: Order codes . Minor grammatical and formatting changes throughout.
18-Jun-2007	4	Values for thermal resistance junction to ambient and ESD HBM corrected in Table 1: Absolute maximum ratings (AMR) . Values for thermal resistance junction to case added in Table 1: Absolute maximum ratings (AMR) . Table 2: Operating conditions added. Electrical characteristics figure captions updated. Section 6: Package information updated. Table 7: Order codes moved to end of document.
18-Dec-2007	5	Removed power dissipation parameter from AMR table and added maximum junction temperature. Updated footnotes for automotive grade order codes. Updated format of package information.
