

## Precision dual operational amplifier

### Features

- Low input offset voltage: 500  $\mu$ V max.
- Low power consumption
- Short-circuit protection
- Low distortion, low noise
- High gain-bandwidth product: 3 MHz
- High channel separation
- ESD protection 2 kV
- Macromodel included in this specification

### Description

The TS512 is a high performance dual operational amplifier with frequency and phase compensation built into the chip. The internal phase compensation allows stable operation in voltage follower in spite of its high gain-bandwidth product.

The circuit presents very stable electrical characteristics over the entire supply voltage range, and is particularly intended for professional and telecom applications (such as active filtering).

# 1 Absolute maximum ratings and operating conditions

**Table 1. Absolute maximum ratings**

Symbol	Parameter	Value	Unit
$V_{CC}$	Supply voltage	$\pm 18$	V
$V_{in}$	Input voltage	$\pm V_{CC}$	
$V_{id}$	Differential input voltage	$\pm(V_{CC} - 1)$	
$R_{thja}$	Thermal resistance junction to ambient <sup>(1)</sup>		$^{\circ}C/W$
	DIP8 SO-8	85 125	
$R_{thjc}$	Thermal resistance junction to case <sup>(1)</sup>		$^{\circ}C/W$
	DIP8 SO-8	41 40	
$T_j$	Junction temperature	+ 150	$^{\circ}C$
$T_{stg}$	Storage temperature range	-65 to +150	$^{\circ}C$
ESD	HBM: human body model <sup>(2)</sup>	2	kV
	MM: machine model <sup>(3)</sup>	200	V
	CDM: charged device model <sup>(4)</sup>	1.5	kV

- Short-circuits can cause excessive heating and destructive dissipation.  $R_{th}$  are typical values.
- Human body model: A 100 pF capacitor is charged to the specified voltage, then discharged through a 1.5 k $\Omega$  resistor between two pins of the device. This is done for all couples of connected pin combinations while the other pins are floating.
- Machine model: A 200 pF capacitor is charged to the specified voltage, then discharged directly between two pins of the device with no external series resistor (internal resistor < 5  $\Omega$ ). This is done for all couples of connected pin combinations while the other pins are floating.
- Charged device model: all pins and the package are charged together to the specified voltage and then discharged directly to the ground through only one pin. This is done for all pins.

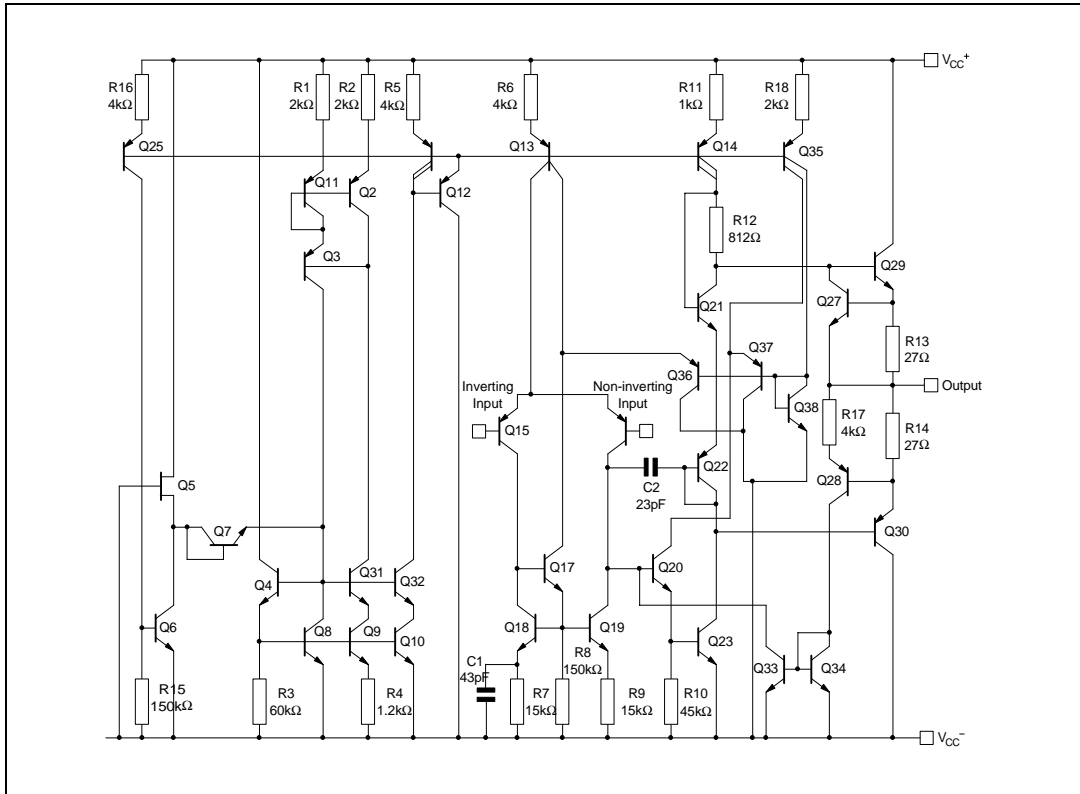

**Table 2. Operating conditions**

Symbol	Parameter	Value	Unit
$V_{CC}$	Supply voltage <sup>(1)</sup>	6 to 30V	V
$V_{icm}$	Common mode input voltage range	$V_{DD}+1.5$ to $V_{CC}-1.5$	V
$T_{oper}$	Operating free air temperature range	-40 to +125	$^{\circ}C$

- Value with respect to  $V_{DD}$  pin.

## 4 Macromodels

### 4.1 Important note concerning this macromodel

Please consider the following remarks before using this macromodel.

- All models are a trade-off between accuracy and complexity (i.e. simulation time).
- Macromodels are not a substitute to breadboarding; rather, they confirm the validity of a design approach and help to select surrounding component values.
- A macromodel emulates the **nominal** performance of a **typical** device within **specified operating conditions** (temperature, supply voltage, for example). Thus the macromodel is often not as exhaustive as the datasheet, its purpose is to illustrate the main parameters of the product.

Data derived from macromodels used outside of the specified conditions ( $V_{CC}$ , temperature, for example) or even worse, outside of the device operating conditions ( $V_{CC}$ ,  $V_{icm}$ , for example), is not reliable in any way.

## 5 Package information

In order to meet environmental requirements, ST offers these devices in ECOPACK® packages. These packages have a lead-free second level interconnect. The category of second level interconnect is marked on the package and on the inner box label, in compliance with JEDEC Standard JESD97. The maximum ratings related to soldering conditions are also marked on the inner box label. ECOPACK is an ST trademark. ECOPACK specifications are available at: [www.st.com](http://www.st.com).
