BURR - BROWN®

OPA606

Wide-Bandwidth *Difet*® OPERATIONAL AMPLIFIER

FEATURES

- WIDE BANDWIDTH: 13MHz typ
- HIGH SLEW RATE: 35V/μs typ
- LOW BIAS CURRENT: 10pA max at T_A = +25°C
- LOW OFFSET VOLTAGE: 500μV max
- LOW DISTORTION: 0.0035% typ at 10kHz

APPLICATIONS

- OPTOELECTRONICS
- DATA ACQUISITION
- TEST EQUIPMENT
- AUDIO AMPLIFIERS

DESCRIPTION

The OPA606 is a wide-bandwidth monolithic dielectrically-isolated FET (***Difet***®) operational amplifier featuring a wider bandwidth and lower bias current than BIFET® LF156A amplifiers. Bias current is specified under warmed-up and operating conditions, as opposed to a junction temperature of +25°C.

Laser-trimmed thin-film resistors offer improved offset voltage and noise performance.

The OPA606 is internally compensated for unity-gain stability.

ABSOLUTE MAXIMUM RATINGS

Supply Voltage	±18VDC
Internal Power Dissipation (1)	500mW
Differential Input Voltage	±36VDC
Input Voltage Range	±18VDC
Storage Temperature Range	M = –65°C to +150°C
	P = –40°C to +85°C
Operating Temperature Range	M = –55°C to +125°C
	P = –40°C to +85°C
Lead Temperature (soldering, 10s)	+300°C
Output Short-Circuit Duration(3)	Continuous
Junction Temperature	+175°C

NOTES: (1) Packages must be derated based on θ_{JC} = 15°C/W or θ_{JA}. (2) For supply voltages less than ±18VDC, the absolute maximum input voltage is equal to the negative supply voltage. (3) Short circuit may be to power supply common only. Rating applies to +25°C ambient. Observe dissipation limit and T_J.

APPLICATIONS INFORMATION

OFFSET VOLTAGE ADJUSTMENT

The OPA606 offset voltage is laser-trimmed and will require no further trim for most applications. As with most amplifiers, externally trimming the remaining offset can change drift performance by about 0.5µV/°C for each millivolt of adjusted offset. Note that the trim (Figure 1) is similar to operational amplifiers such as LF156 and OP-16. The OPA606 can replace most other amplifiers by leaving the external null circuit unconnected.

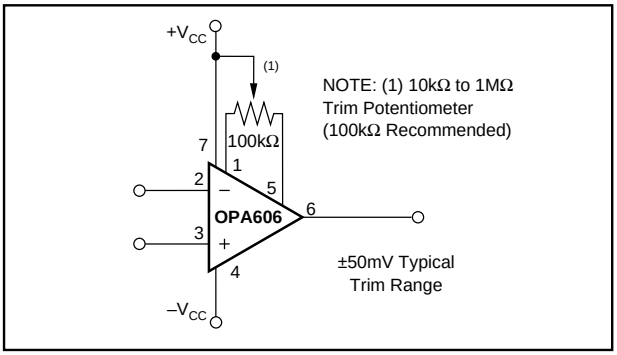

FIGURE 1. Offset Voltage Trim.

INPUT PROTECTION

Static damage can cause subtle changes in amplifier input characteristics without necessarily destroying the device. In precision operational amplifiers (both bipolar and FET types), this may cause a noticeable degradation of offset voltage and drift. Static protection is recommended when handling any precision IC operational amplifier.

If the input voltage exceeds the amplifier's negative supply voltage, input current limiting must be used to prevent damage.

CIRCUIT LAYOUT

Wideband amplifiers require good circuit layout techniques and adequate power supply bypassing. Short, direct connections and good high frequency bypass capacitors (ceramic or tantalum) will help avoid noise pickup or oscillation.

GUARDING AND SHIELDING

As in any situation where high impedances are involved, careful shielding is required to reduce "hum" pickup in input leads. If large feedback resistors are used, they should also be shielded along with the external input circuitry.

Leakage currents across printed circuit boards can easily exceed the bias current of the OPA606. To avoid leakage problems, it is recommended that the signal input lead of the OPA606 be wired to a Teflon® standoff. If the OPA606 is to be soldered directly into a printed circuit board, utmost care must be used in planning the board layout.

A "guard" pattern should completely surround the high impedance input leads and should be connected to a low impedance point which is at the signal input potential (see Figure 3).
