TC1034/TC1035

Linear Building Block – Single Operational Amplifiers in SOT Packages

Features

- Tiny SOT-23A Package
- Optimized for Single Supply Operation
- Ultra Low Input Bias Current: Less than 100pA
- Low Quiescent Current: 6µA (Typ.)
  Shutdown Mode: 0.05µA (Typ.) (TC1035)
- Shutdown Mode (TC1035)
- Rail-to-Rail Inputs and Outputs

Applications

- Power Management Circuits
- Battery Operated Equipment
- Consumer Products

Device Selection Table

Part Number	Package	Temperature Range
TC1034ECT	5-Pin SOT-23A	-40°C to +85°C
TC1035ECH	6-Pin SOT-23A	-40°C to +85°C

Package Types

5-Pin SOT-23A — TC1034ECT

VSS (5), IN- (4), OUTPUT (1), V_{DD} (2), IN+ (3)

6-Pin SOT-23A — TC1035ECH

VSS (6), $\overline{SHDN}$ (5), IN- (4), OUTPUT (1), V_{DD} (2), IN+ (3)

NOTE: 5-Pin SOT-23A is equivalent to the EIAJ SC-74A.
6-Pin SOT-23A is equivalent to the EIAJ SC-74.

General Description

The TC1034/TC1035 are single CMOS operational amplifiers for low power applications.

They have a typical operating supply current of 6µA, which is constant over the supply voltage range of 1.8V to 5.5V. The Op Amp has a rail-to-rail input and output which allows operation at low supply voltages with large input and output signal swings.

An active low shutdown input, $\overline{SHDN}$, is available on the TC1035 and disables the op amp, placing its output in a high-impedance state. The TC1035 draws less than 0.1µA when the shutdown mode is active.

Packaged in a 5-Pin SOT-23A (TC1034) or 6-Pin SOT-23A (TC1035), these single operational amplifiers are ideal for applications requiring high integration, small size and low power.

Functional Block Diagram

TC1034: OUTPUT (1), V_{DD} (2), IN+ (3), V_{SS} (5), IN- (4)

TC1035: OUTPUT (1), V_{DD} (2), IN+ (3), V_{SS} (6), $\overline{SHDN}$ (5), IN- (4)

2.0   PIN DESCRIPTIONS

The description of the pins are listed in Table 2-1.

TABLE 2-1:   PIN FUNCTION TABLE

Pin No. TC1034 (5-Pin SOT-23A)	Symbol	Description
1	OUT	Operational amplifier output.
2	V_{DD}	Positive power supply.
3	IN+	Operational amplifier non-inverting input.
4	IN-	Operational amplifier inverting input.
5	V_{SS}	Negative power supply.

Pin No. TC1035 (6-Pin SOT-23A)	Symbol	Description
1	OUT	Operational amplifier output.
2	V_{DD}	Positive power supply.
3	IN+	Operational amplifier non-inverting input.
4	IN-	Operational amplifier inverting input.
5	$\overline{SHDN}$	Active Low Shutdown Input (TC1035 only). A low input on this pin disables the operational amplifier and places the output terminal in a high-impedance state.
6	V_{SS}	Negative power supply.

3.0   DETAILED DESCRIPTION

The TC1034/TC1035 is one of a series of very low power, linear building block products targeted at low voltage, single supply applications. The TC1034/TC1035 minimum operating voltage is 1.8V and maximum supply current is only 8μA. The TC1034 is a single op amp in a 5-Pin SOT-23A package, and the TC1035 is a single op amp with shutdown input in a 6-Pin SOT-23A package.

Microchip's op amps are internally compensated to be unity gain stable and have a typical gain bandwidth product of 90kHz with typical slew rates of 35V/msec.

The amplifier's input range extends beyond both supplies by 200mV and the outputs will swing to within several millivolts of the supplies depending on the load current being driven.

Input offset voltage is 500μV max at 25°C with an input bias current of less than 100pA. This makes these devices extremely suitable for precision, low power applications.

4.0   TYPICAL APPLICATIONS

The TC1034/TC1035 lends itself to a wide variety of applications, particularly in battery powered systems. It typically finds applications in power management, processor supervisory and interface circuitry.

4.1   Voice Band Receive Filter

The majority of spectral energy for human voices is found to be in a 2.7kHz frequency band from 300Hz to 3kHz. To properly recover a voice signal in applications such as radios, cellular phones and voice pagers, a low power bandpass filter that is matched to the human voice spectrum can be implemented using Microchip's CMOS op amps. Figure 4-1 shows a unity gain multi-pole Butterworth filter with ripple less than 0.15dB in the human voice band. The lower 3dB cut-off frequency is 70Hz (single order response), while the upper cut-off frequency is 3.5kHz (fourth order response).

4.2   Supervisory Audio Tone (SAT) Filter for Cellular

Supervisory Audio Tones (SAT) provide a reliable transmission path between cellular subscriber units and base stations. The SAT tone functions much like the current/voltage used in land line telephone systems to indicate that a phone is off the hook. The SAT tone may be one of three frequencies: 5970, 6000 or 6030Hz. A loss of SAT implies that channel conditions are impaired and if SAT is interrupted for more than 5 seconds a cellular call is terminated.

Figure 4-2 shows a high Q (30) second order SAT detection bandpass filter using Microchip's CMOS op amp architecture. This circuit nulls all frequencies except the three SAT tones of interest.
