SGLS229B - FEBRUARY 2004 - REVISED JUNE 2008

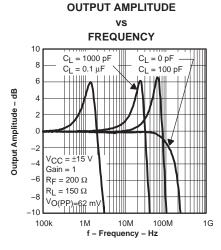

- Qualified for Automotive Applications
- C-Stable Amplifier Drives Any Capacitive Load
- High Speed
  - 165 MHz Bandwidth (-3 dB);  $C_L = 0 \text{ pF}$
  - 100 MHz Bandwidth (-3 dB); C<sub>L</sub> = 100 pF
  - 35 MHz Bandwidth (-3 dB); CL = 1000 pF
  - 400 V/µs Slew Rate
- Unity Gain Stable
- High Output Drive, I<sub>O</sub> = 100 mA (typ)
- Low Distortion
  - THD = -75 dBc (f = 1 MHz,  $R_L$  = 150 Ω)
  - THD = -89 dBc (f = 1 MHz,  $R_L = 1 k\Omega$ )
- Wide Range of Power Supplies - V<sub>CC</sub> = ±5 V to ±15 V
- Evaluation Module Available

#### description/ordering information

The THS4041 is a single, high-speed voltage feedback amplifier capable of driving any capacitive load. This makes it ideal for a wide range of applications including driving video lines or buffering ADCs. The device features high 165-MHz bandwidth and 400-V/ $\mu$ s slew rate. The THS4041 is stable at all

NC - No internal connection

gains for both inverting and noninverting configurations. For video applications, the THS4041 offers excellent video performance with 0.01% differential gain error and 0.01° differential phase error. This amplifier can drive up to 100 mA into a 20- $\Omega$  load and operate off power supplies ranging from ±5 V to ±15 V.

#### **ORDERING INFORMATION<sup>†</sup>**

T <sub>A</sub>	NUMBER OF CHANNELS	PACKA	GE <sup>‡</sup>	ORDERABLE PART NUMBER	TOP-SIDE MARKING
-40°C to 85°C	1	SOIC (D)	Tape and Reel	THS4041IDRQ1	4041Q1

<sup>†</sup> For the most current package and ordering information, see the Package Option Addendum at the end of this document, or see the TI web site at http://www.ti.com.

<sup>‡</sup>Package drawings, thermal data, and symbolization are available at http://www.ti.com/packaging.

CAUTION: The THS4041 provides ESD protection circuitry. However, permanent damage can still occur if this device is subjected to high-energy electrostatic discharges. Proper ESD precautions are recommended to avoid any performance degradation or loss of functionality.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

PowerPAD is a trademark of Texas Insruments Incorporated.

PRODUCTION DATA information is current as of publication date. Products conform to specifications per the terms of Texas Instruments standard warranty. Production processing does not necessarily include testing of all parameters.

SGLS229B - FEBRUARY 2004 - REVISED JUNE 2008

## functional block diagram

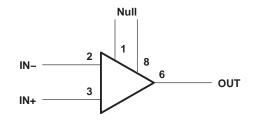

Figure 1. THS4041 – Single Channel

## absolute maximum ratings over operating free-air temperature (unless otherwise noted)<sup>†</sup>

Supply voltage, V <sub>CC</sub> Input voltage, V <sub>I</sub>	
Output current, I <sub>O</sub>	
Differential input voltage, VIO	
Maximum junction temperature, T <sub>J</sub> (see Figure 2)	150°C
Package thermal impedance, $\theta_{JA}$ (see Note 1)	215°C/W
Operating free-air temperature, T <sub>A</sub> : I-suffix	–40°C to 85°C
Storage temperature, T <sub>stg</sub>	65°C to 150°C
Lead temperature 1,6 mm (1/16 inch) from case for 3 seconds	300°C

<sup>†</sup> Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

NOTE 1: This data was taken using the JEDEC standard Low-K test PCB. For the JEDEC proposed High-K test PCB, the  $\theta_{JA}$  is 126°C/W.

# TYPICAL CHARACTERISTICS

# **APPLICATION INFORMATION**

## theory of operation

The THS404x is a high-speed, operational amplifier configured in a voltage feedback architecture. It is built using a 30-V, dielectrically isolated, complementary bipolar process with NPN and PNP transistors possessing  $f_{TS}$  of several GHz. This results in an exceptionally high performance amplifier that has a wide bandwidth, high slew rate, fast settling time, and low distortion. A simplified schematic is shown in Figure 62.

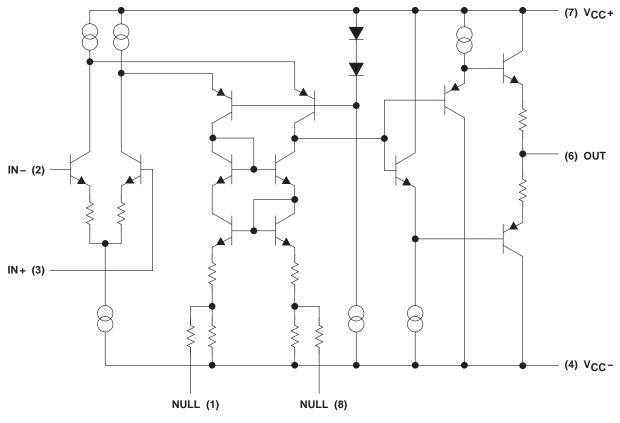

Figure 62. THS4041 Simplified Schematic

## noise calculations and noise figure

Noise can cause errors on small signals. This is especially true when amplifying small signals, where signal-to-noise ration (SNR) is important. The noise model for the THS404x is shown in Figure 63. This model includes all of the noise sources as follows:

- $e_n = \text{Amplifier internal voltage noise } (nV/\sqrt{Hz})$
- IN+ = Noninverting current noise (pA/ $\sqrt{Hz}$ )
- IN- = Inverting current noise (pA/ $\sqrt{Hz}$ )
- $e_{Rx}$  = Thermal voltage noise associated with each resistor ( $e_{Rx}$  = 4 kTR<sub>x</sub>)

SGLS229B - FEBRUARY 2004 - REVISED JUNE 2008

## **APPLICATION INFORMATION**

## noise calculations and noise figure (continued)

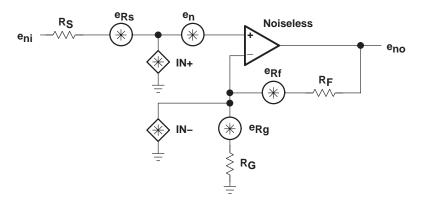

Figure 63. Noise Model

The total equivalent input noise density (eni) is calculated by using the following equation:

$$\mathbf{e}_{ni} = \sqrt{\left(\mathbf{e}_{n}\right)^{2} + \left(\mathbf{IN} + \times \mathbf{R}_{S}\right)^{2} + \left(\mathbf{IN} - \times \left(\mathbf{R}_{F} \parallel \mathbf{R}_{G}\right)\right)^{2} + 4 \text{ kTR}_{s} + 4 \text{ kT}\left(\mathbf{R}_{F} \parallel \mathbf{R}_{G}\right)^{2}}$$

Where:

 $k = Boltzmann's \ constant = 1.380658 \times 10^{-23} \\ T = Temperature in \ degrees \ Kelvin \ (273 + ^{\circ}C) \\ R_F \ || \ R_G = Parallel \ resistance \ of \ R_F \ and \ R_G$ 

To get the equivalent output noise of the amplifier, just multiply the equivalent input noise density  $(e_{ni})$  by the overall amplifier gain  $(A_V)$ .

$$e_{no} = e_{ni} A_V = e_{ni} \left( 1 + \frac{R_F}{R_G} \right)$$
 (noninverting case)

As the previous equations show, to keep noise at a minimum, small value resistors should be used. As the closed-loop gain is increased (by reducing  $R_G$ ), the input noise is reduced considerably because of the parallel resistance term. This leads to the general conclusion that the most dominant noise sources are the source resistor ( $R_S$ ) and the internal amplifier noise voltage ( $e_n$ ). Because noise is summed in a root-mean-squares method, noise sources smaller than 25% of the largest noise source can be effectively ignored. This can greatly simplify the formula and make noise calculations much easier to calculate.

For more information on noise analysis, see the *Noise Analysis* section in the *Operational Amplifier Circuits Applications Report* (literature number SLVA043).

## **APPLICATION INFORMATION**

#### noise calculations and noise figure (continued)

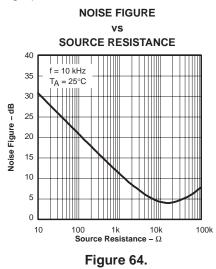

This brings up another noise measurement usually preferred in RF applications, the noise figure (NF). The noise figure is a measure of noise degradation caused by the amplifier. The value of the source resistance must be defined and is typically 50  $\Omega$  in RF applications.

$$NF = 10log\left[\frac{e_{ni}^{2}}{\left(e_{Rs}\right)^{2}}\right]$$

Because the dominant noise components are generally the source resistance and the internal amplifier noise voltage, we can approximate noise figure as:

$$NF = 10log \left[ 1 + \frac{\left( \left( e_n \right)^2 + \left( IN + \times R_S \right)^2 \right)}{4 \text{ kTR}_S} \right]$$

Figure 64 shows the noise figure graph for the THS404x.

## driving a capacitive load

Driving capacitive loads with high performance amplifiers is not a problem as long as certain precautions are taken. The first is to realize that the THS404x has been internally compensated to maximize its bandwidth and slew rate performance. Typically when the amplifier is compensated in this manner, capacitive loading directly on the output will decrease the device's phase margin, leading to high frequency ringing or oscillations. However, the THS404x has added internal circuitry that senses a capacitive load and adds extra compensation to the internal dominant pole. As the capacitive load increases, the amplifier remains stable. But, it is not uncommon to see a small amount of peaking in the frequency response. There are typically two ways to compensate for this. The first is to simply increase the gain of the amplifier. This helps by increasing the phase margin to keep peaking minimized. The second is to place an isolation resistor in series with the output of the amplifier, as shown in Figure 65. A minimum value of  $20 \Omega$  should work well for most applications. For example, in 75- $\Omega$  transmission systems, setting the series resistor value to 75  $\Omega$  both isolates any capacitance loading and provides the proper line impedance matching at the source end. For more information about driving capacitive loads, see the *Output Resistance and Capacitance* section of the *Parasitic Capacitance in Op Amp Circuits Application Report* (literature number SLOA013).

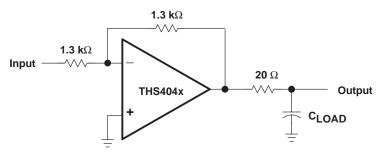

Figure 65. Driving a Capacitive Load for Extra Stability

## offset nulling

The THS404x has low input offset voltage for a high-speed amplifier. However, if additional correction is required, an offset nulling function has been provided on the THS4041. The input offset can be adjusted by placing a potentiometer between terminals 1 and 8 of the device and tying the wiper to the negative supply. This is shown in Figure 66.

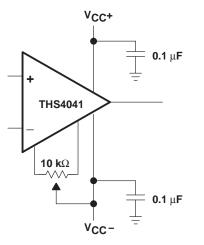

Figure 66. Offset Nulling Schematic

# **APPLICATION INFORMATION**

### offset voltage

The output offset voltage, ( $V_{OO}$ ) is the sum of the input offset voltage ( $V_{IO}$ ) and both input bias currents ( $I_{IB}$ ) times the corresponding gains. The following schematic and formula can be used to calculate the output offset voltage:

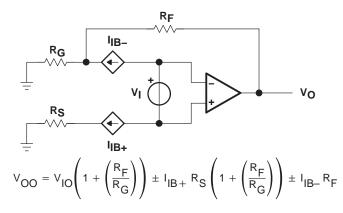

Figure 67. Output Offset Voltage Model

## optimizing unity gain response

Internal frequency compensation of the THS404x was selected to provide very wideband performance yet still maintain stability when operated in a noninverting unity gain configuration. When amplifiers are compensated in this manner there is usually peaking in the closed loop response and some ringing in the step response for fast input edges, depending upon the application. This is because a minimum phase margin is maintained for the G=+1 configuration. For optimum settling time and minimum ringing, a feedback resistor of 200  $\Omega$  should be used as shown in Figure 68. Additional capacitance can also be used in parallel with the feedback resistance if even finer optimization is required.

### circuit layout considerations

To achieve the levels of high frequency performance of the THS404x, follow proper printed-circuit board high frequency design techniques. A general set of guidelines is given below. In addition, a THS404x evaluation board is available to use as a guide for layout or for evaluating the device performance.

- Ground planes It is highly recommended that a ground plane be used on the board to provide all components with a low inductive ground connection. However, in the areas of the amplifier inputs and output, the ground plane can be removed to minimize the stray capacitance.
- Proper power supply decoupling Use a 6.8-µF tantalum capacitor in parallel with a 0.1-µF ceramic capacitor on each supply terminal. It may be possible to share the tantalum among several amplifiers depending on the application, but a 0.1-µF ceramic capacitor should always be used on the supply terminal of every amplifier. In addition, the 0.1-µF capacitor should be placed as close as possible to the supply terminal. As this distance increases, the inductance in the connecting trace makes the capacitor less effective. The designer should strive for distances of less than 0.1 inches between the device power terminals and the ceramic capacitors.
- Sockets Sockets are not recommended for high-speed operational amplifiers. The additional lead
  inductance in the socket pins often leads to stability problems. Surface-mount packages soldered directly
  to the printed-circuit board is the best implementation.
- Short trace runs/compact part placements Optimum high frequency performance is achieved when stray series inductance has been minimized. To realize this, the circuit layout should be made as compact as possible, thereby minimizing the length of all trace runs. Particular attention should be paid to the inverting input of the amplifier. Its length should be kept as short as possible. This helps to minimize stray capacitance at the input of the amplifier.
- Surface-mount passive components Using surface-mount passive components is recommended for high
  frequency amplifier circuits for several reasons. First, because of the extremely low lead inductance of
  surface-mount components, the problem with stray series inductance is greatly reduced. Second, the small
  size of surface-mount components naturally leads to a more compact layout, thereby minimizing both stray
  inductance and capacitance. If leaded components are used, it is recommended that the lead lengths be
  kept as short as possible.

### evaluation board

An evaluation board is available for the THS4041 (literature number SLOP219). This board has been configured for very low parasitic capacitance in order to realize the full performance of the amplifier. A schematic of the evaluation board is shown in Figure 69. The circuitry has been designed so that the amplifier may be used in either an inverting or noninverting configuration. For more information, see the *THS4041 EVM User's Guide*. To order the evaluation board, contact your local Texas Instruments sales office or distributor.

## PACKAGING INFORMATION

Orderable Device	Status <sup>(1)</sup>	Package Type	Package Drawing	Pins	Package Qty	e Eco Plan <sup>(2)</sup>	Lead/Ball Finish	MSL Peak Temp <sup>(3)</sup>
THS4041IDRG4Q1	ACTIVE	SOIC	D	8	2500	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-1-260C-UNLIM
THS4041IDRQ1	ACTIVE	SOIC	D	8	2500	Pb-Free (RoHS)	CU NIPDAU	Level-2-250C-1 YEAR/ Level-1-235C-UNLIM

<sup>(1)</sup> The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

<sup>(2)</sup> Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check http://www.ti.com/productcontent for the latest availability information and additional product content details. **TBD:** The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

<sup>(3)</sup> MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

#### **IMPORTANT NOTICE**

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
