## Dual, 500MHz Triple, Multiplexing Amplifiers

The ISL59482 contains two independent fixed gain of 2 triple 4:1 MUX amplifiers that feature high slew rate and excellent bandwidth for RGB video switching. Each RGB 4:1 MUX contains binary coded, channel select logic inputs (S0, S1), and separate logic inputs for High Impedance Output (HIZ) and power-down ( $\overline{\mathrm{EN}}$ ) modes. The HIZ state presents a high impedance at the output so that both RGB MUX outputs can be wired together to form an 8:1 RGB MUX amplifier or, they can be used in R-R, G-G, and B-B pairs to form a $4: 1$ differential input/output MUX. Separate power-down mode controls (EN1, EN2,) are included to turn off unneeded circuitry in power sensitive applications. With both $\overline{\mathrm{EN}}$ pins pulled high, the ISL59482 enters a standby power modeconsuming just 34 mW .

| 1 | 1 | 0 | 0 | IN3 (A, B, C) |
| $X$ | $X$ | 1 | $X$ | Power-down |
| $X$ | $X$ | 0 | 1 | High Z |

## Features

- Dual, Triple 4:1 Multiplexers for RGB
- 520 MHz Bandwidth into $500 \Omega$ Load
- $\pm 1600$ V/ $\mu$ s Slew Rate
- Externally Configurable for Various Video MUX Circuits Including:
- 8:1 RGB MUX
- Two Separate 4:1 RGB MUX
- 4:1 Differential RGB Video MUX
- Internally Fixed Gain-of-2
- High Impedance Outputs (HIZ)
- Power-Down Mode ( $\overline{\mathrm{EN}}$ )
- $\pm 5 \mathrm{~V}$ Operation
- Supply Current 16mA/Ch maximum
- Pb-free Plus Anneal Available (RoHS Compliant)

## Applications

- HDTV/DTV analog inputs
- Video projectors, Computer monitors
- Set-top boxes
- Security video
- Broadcast video equipment

## Ordering Information

| PART NUMBER <br> (Note) |  <br> PART MARKING | PACKAGE <br> REEL | PKG. <br> DWG. \# |  |
| :--- | :--- | :---: | :--- | :--- |
| ISL59482IRZ | ISL59482 IRZ | - | 48 Ld Exposed Pad 7x7 QFN | L48.7x7B |
| ISL59482IRZ-T13 | ISL59482 IRZ | $13 "$ | 48 Ld Exposed Pad 7x7 QFN | L48.7x7B |

NOTE: Intersil Pb-free plus anneal products employ special Pb-free material sets; molding compounds/die attach materials and 100\% matte tin plate termination finish, which are RoHS compliant and compatible with both SnPb and Pb-free soldering operations. Intersil Pb-free products are MSL classified at Pb-free peak reflow temperatures that meet or exceed the Pb-free requirements of IPC/JEDEC J STD-020.

CAUTION: Stresses above those listed in "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress only rating and operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied.

NOTE:

1. If an input signal is applied before the supplies are powered up, the input current must be limited to these maximum values.

IMPORTANT NOTE: All parameters having Min/Max specifications are guaranteed. Typical values are for information purposes only. Unless otherwise noted, all tests are at the specified temperature and are pulsed tests, therefore: $T_{J}=T_{C}=T_{A}$

Electrical Specifications $\quad \mathrm{V} 1+=\mathrm{V} 2+=+5 \mathrm{~V}, \mathrm{~V} 1-=\mathrm{V} 2-=-5 \mathrm{~V}, \mathrm{GND}=0 \mathrm{~V}, \mathrm{~T}_{\mathrm{A}}=+25^{\circ} \mathrm{C}$, Input Video $=0.5 \mathrm{~V}_{\mathrm{P}-\mathrm{P}}$ and $\mathrm{R}_{\mathrm{L}}=500 \Omega$ to GND , $C_{L}=5 p F$ unless otherwise specified.

## Application Information

## General

The ISL59482 is ideal as the matrix element of high performance switchers and routers. Key features include internal fixed gain of 2, high impedance buffered analog inputs and excellent AC performance at output loads down to $150 \Omega$ for video cable-driving. The current feedback output amplifiers are stable operating into capacitive loads.

## Ground Connections

For the best isolation and crosstalk rejection, all GND pins must connect to the GND plane.

## Power-up Considerations

The ESD protection circuits use internal diodes from all pins the $\mathrm{V}+$ and V - supplies. In addition, a dV/dT- triggered clamp is connected between the $\mathrm{V}+$ and V - pins, as shown in the Equivalent Circuits 1 through 4 section of the Pin Description table. The dV/dT triggered clamp imposes a maximum supply turn-on slew rate of $1 \mathrm{~V} / \mu \mathrm{s}$. Damaging currents can flow for power supply rates-of-rise in excess of $1 \mathrm{~V} / \mu \mathrm{s}$, such as during hot plugging. Under these conditions, additional methods should be employed to ensure the rate of rise is not exceeded.

Consideration must be given to the order in which power is applied to the $\mathrm{V}+$ and V - pins, as well as analog and logic input pins. Schottky diodes (Motorola MBR0550T or equivalent) connected from V + to ground and V - to ground (Figure 28) will shunt damaging currents away from the internal $\mathrm{V}+$ and V - ESD diodes in the event that the $\mathrm{V}+$ supply is applied to the device before the $V$ - supply. One Schottky can be used to protect both $\mathrm{V}+$ power supply pins, and a second for the protection of both $V$ - pins.

If positive voltages are applied to the logic or analog video input pins before $\mathrm{V}+$ is applied, current will flow through the internal ESD diodes to the $V+$ pin. The presence of large decoupling capacitors and the loading effect of other circuits connected to $\mathrm{V}+$, can result in damaging currents through the ESD diodes and other active circuits within the device.

Therefore, adequate current limiting on the digital and analog inputs is needed to prevent damage during the time the voltages on these inputs are more positive than $\mathrm{V}+$.

## HIZ State

Each internal 4:1 triple MUX-amp has a three-state output control pin (HIZ1 and HIZ2). Each has a an internal pulldown resistor to set the output to the enabled state with no connection to the HIZ pin. The HIZ state is established within approximately 20 ns by placing a logic high ( $>2 \mathrm{~V}$ ) on the HIZ pin. If the HIZ state is selected, the output is a high impedance $1.4 \mathrm{M} \Omega$ with approximately 1.5 pF in parallel with a $10 \mu \mathrm{~A}$ bias current from the output. When more than one MUX shares a common output, the high impedance state loading effect is minimized over the maximum output voltage swing and maintains its high $Z$ even in the presence of high slew rates. The supply current during this state is the same as the active state.

## EN and Power-down States

The EN pin is active low. An internal pull-down resistor ensures the device will be active with no connection to the $\overline{\mathrm{EN}}$ pin. The Power-down state is established within approximately 80 ns , if a logic high ( $>2 \mathrm{~V}$ ) is placed on the $\overline{\mathrm{EN}}$ pin. In the Power-down state, supply current is reduced significantly by shutting the three amplifiers off. The output presents a high impedance to the output pin, however, there is a risk that the disabled amplifier output can be back-driven at signal voltage levels exceeding $2 \mathrm{~V}_{\mathrm{P}-\mathrm{P} \text {. Under this }}$ condition, large incoming slew rates can cause fault currents of tens of mA. Therefore, the parallel connection of multiple outputs is not recommended unless the application can tolerate the limited power-down output impedance.

## Limiting the Output Current

No output short circuit current limit exists on these parts. All applications need to limit the output current to less than 50 mA . Adequate thermal heat sinking of the parts is also required.

## PC Board Layout

The AC performance of this circuit depends greatly on the care taken in designing the PC board. The following are recommendations to achieve optimum high frequency performance from your PC board.

- The use of low inductance components such as chip resistors and chip capacitors is strongly recommended.
- Minimize signal trace lengths. Trace inductance and capacitance can easily limit circuit performance. Avoid sharp corners, use rounded corners when possible. Vias in the signal lines add inductance at high frequency and should be avoided. PCB traces greater than 1" begin to exhibit transmission line characteristics with signal rise/fall times of 1 ns or less. High frequency performance may be degraded for traces greater than one inch, unless strip line are used.
- Match channel-channel analog I/O trace lengths and layout symmetry. This will minimize propagation delay mismatches.
- Maximize use of AC de-coupled PCB layers. All signal I/O lines should be routed over continuous ground planes (i.e. no split planes or PCB gaps under these lines). Avoid vias in the signal I/O lines.
- Use proper value and location of termination resistors. Termination resistors should be as close to the device as possible.
- When testing use good quality connectors and cables, matching cable types and keeping cable lengths to a minimum.
- Minimum of 2 power supply decoupling capacitors are recommended ( $1000 \mathrm{pF}, 0.01 \mu \mathrm{~F}$ ) as close to the devices as possible. Avoid vias between the cap and the device because vias add unwanted inductance. Larger caps can be farther away. When vias are required in a layout, they should be routed as far away from the device as possible.
- The NIC pins are placed on both sides of the input pins. These pins are not internally connected to the die. It is recommended these pins be tied to ground to minimize crosstalk.

## The QFN Package Requires Additional PCB Layout Rules for the Thermal Pad

The thermal pad is electrically connected to V-supply through the high resistance IC substrate. Its primary function is to provide heat sinking for the IC. However, because of the connection to the V1- and V2- supply pins through the substrate, the thermal pad must be tied to the V - supply to prevent unwanted current flow to the thermal pad. Do not tie this pin to GND as this could result in large back biased currents flowing between GND and the V-pins. Maximum AC performance is achieved if the thermal pad is attached to a dedicated decoupled layer in a multi-layered PC board. In cases where a dedicated layer is not possible, AC performance may be reduced at upper frequencies.

The thermal pad requirements are proportional to power dissipation and ambient temperature. A dedicated layer eliminates the need for individual thermal pad area. When a dedicated layer is not possible, an isolated thermal pad on another layer should be used. Pad area requirements should be evaluated on a case by case basis.

## MUX Application Circuits

Each of the two 4:1 triple MUX amplifiers have their own binary-coded, TTL compatible channel select logic inputs (S0-1, 2, and S1-1, 2). All three amplifiers are switched simultaneously from their respective inputs with S0-1 S1-1 controlling MUX-amp1, and S0-2, S1-2 controlling MUX-amp2.

The HIZ control inputs (HIZ1, HIZ2) and device enable control inputs ( $\overline{\mathrm{EN} 1}$ and $\overline{\mathrm{EN} 2}$ ) control MUX-amp1 and MUX-amp2 in a similar fashion. The individual control for each 4:1 triple MUX enables external connections to configure the device for different MUX applications.

## 8:1 RGB Video MUX

For a triple input RGB 8:1 MUX (Figure 4), the RGB amplifier outputs of MUX-amp1 are parallel-connected to the RGB amplifier outputs of MUX-amp2 to produce the single RGB video output. Input channels CH 0 to CH 3 are assigned to MUX-amp1, and channels CH 4 through CH 7 are assigned to MUX-amp2. Channels CH 0 through CH 3 are selected by setting HIZ1 low, HIZ2 high (enables MUX-amp1 and threestates MUX-amp2) and the appropriate channel select logic to S0-1, S1-1. Reversing the logic inputs of HIZ1, HIZ2 switches from MUX-amp1 to MUX-amp2 enabling the selection of channels CH 4 through CH 7 . The channel select inputs are parallel connected (SO-1 to S0-2) and (S1-1 to $\mathrm{S} 1-2$ ) to form two logic controls $\mathrm{S} 0, \mathrm{~S} 1$. A single S 2 control is split into complimentary logic inputs for HIZ1 and HIZ2 to produce a chip select function for the MSB. The logic control truth table is shown in Figure 29.

## 4:1 RGB Differential Video MUX

Connecting the channel select pins in parallel (S0-1 to S0-2 and S1-1 to S1-2) converts the 8 individual RGB video inputs into 4 differential RGB input pairs. The amplifier RGB outputs are similarly paired resulting in a fully differential 4:1 RGB MUX amp shown in Figure 5. Connecting HIZ1 and HIZ2 to +5 V disables the 4:1 differential MUX, and enables the connection of additional differential-connected MUX amplifiers to the same outputs, thus allowing input expansion to $8: 1$ or more.

CHANNEL SELECT TRUTH TABLE 8:1 VIDEO MUX

| S2 | S1 | s0 | OUTA, B, C |
| :---: | :---: | :---: | :---: |

## Package Outline Drawing

## L48.7x7B

48 LEAD QUAD FLAT NO-LEAD PLASTIC PACKAGE Rev 0, 12/06

NOTES:

1. Dimensions are in millimeters.

Dimensions in ( ) for Reference Only.
2. Dimensioning and tolerancing conform to AMSE Y14.5m-1994.
3. Unless otherwise specified, tolerance : Decimal $\pm 0.05$
4. Dimension $b$ applies to the metallized terminal and is measured between 0.15 mm and 0.30 mm from the terminal tip.
5. Tiebar shown (if present) is a non-functional feature.
6. The configuration of the pin \#1 identifier is optional, but must be located within the zone indicated. The pin \#1 indentifier may be either a mold or mark feature.
