Detailed Description

The MAX9650/MAX9651 operational rail-to-rail input/output amplifiers hold the VCOM voltage stable while providing the ability to source and sink a high current quickly (1.3A) into a capacitive load such as the backplane of a TFT-LCD panel.

Thermal Shutdown with Temperature Hysteresis

The MAX9650/MAX9651 are capable of high output currents and feature thermal-shutdown protection with temperature hysteresis. When the die temperature reaches +170°C, the device shuts down. When the die cools down by 15°C, the device turns on again. In a TFT-LCD application, the duty cycle is very low. Even with high values of voltage and current, the power dissipation is low and the chip does not shut down.

Applications Information

Output Load

The MAX9650/MAX9651 are designed to drive capacitive loads. A small value of series resistance improves the performance of the device to ensure stability and fast settling with very large or very small capacitive loads. In many cases, this resistance is already present due to connection resistance in the wiring and no additional physical resistor is necessary.

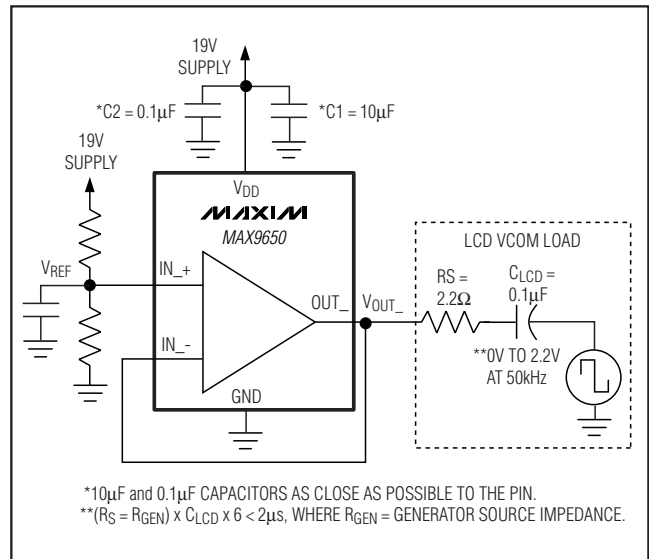

Figure 1. Settling Time Test Circuit

Power Supplies and Bypass Capacitors

The MAX9650/MAX9651 operate from a 9V to 20V single supply or from ±4.5V to ±10V dual supplies. Proper supply bypassing ensures stability while driving high transient loads. The MAX9650/MAX9651 require a minimum 10μF (C1) and 0.1μF (C2) power-supply bypass capacitors placed as close as possible to the power-supply pin

High-Current VCOM Drive Op Amps for TFT LCDs

(V_{DD}). See Figure 2. For dual-supply operation, use 10 μ F and 0.1 μ F bypass capacitors on both supplies (V_{DD} and GND) with each capacitor placed as close as possible to V_{DD} and GND.

Layout and Grounding

The exposed pad on the μ MAX[®] package provides a low thermal resistance for heat dissipation. Solder the exposed pad to a ground plane for best thermal performance. Do not route traces under these packages. For dual-supply operation, the exposed pad (EP) can be electrically connected to the negative supply or it can be left unconnected.
