## Features

- Zero input-output propagation delay, adjustable by capacitive load on FBK input
- Multiple configurations, see "Available CY2308 Configurations" table
- Multiple low-skew outputs
-Output-output skew less than 200 ps
—Device-device skew less than 700 ps
- Two banks of four outputs, three-stateable by two select inputs
- $10-\mathrm{MHz}$ to $133-\mathrm{MHz}$ operating range
- Low jitter, less than 200 ps cycle-cycle ( $-1,-1 \mathrm{H},-4,-5 \mathrm{H}$ )
- Space-saving 16-pin 150-mil SOIC package or 16-pin TSSOP
- 3.3V operation
- Industrial Temperature available

## Functional Description

The CY2308 is a 3.3V Zero Delay Buffer designed to distribute high-speed clocks in PC, workstation, datacom, telecom, and other high-performance applications.
The part has an on-chip PLL which locks to an input clock presented on the REF pin. The PLL feedback is required to be driven into the FBK pin, and can be obtained from one of the outputs. The input-to-output skew is guaranteed to be less than 350 ps , and output-to-output skew is guaranteed to be less than 200 ps.

### 3.3V Zero Delay Buffer

The CY2308 has two banks of four outputs each, which can be controlled by the Select inputs as shown in the table "Selected Input Decoding." If all output clocks are not required, Bank B can be three-stated. The select inputs also allow the input clock to be directly applied to the output for chip and system testing purposes.
The CY2308 PLL enters a power down state when there are no rising edges on the REF input. In this mode, all outputs are three-stated and the PLL is turned off, resulting in less than $50 \mu \mathrm{~A}$ of current draw. The PLL shuts down in two additional cases as shown in the "Select Input Decoding" table.
Multiple CY2308 devices can accept the same input clock and distribute it in a system. In this case, the skew between the outputs of two devices is guaranteed to be less than 700 ps .
The CY2308 is available in five different configurations, as shown in the "Available CY2308 Configurations" table on Page 2. The CY2308-1 is the base part, where the output frequencies equal the reference if there is no counter in the feedback path. The CY2308-1H is the high-drive version of the -1 , and rise and fall times on this device are much faster.
The CY2308-2 allows the user to obtain 2X and 1X frequencies on each output bank. The exact configuration and output frequencies depends on which output drives the feedback pin. The CY2308-3 allows the user to obtain 4 X and 2 X frequencies on the outputs.
The CY2308-4 enables the user to obtain 2X clocks on all outputs. Thus, the part is extremely versatile, and can be used in a variety of applications.
The CY2308-5H is a high-drive version with REF/2 on both banks.

CY2308

Select Input Decoding

| S2 | S1 | CLOCK A1-A4 | CLOCK B1-B4 | Output Source | PLL Shutdown |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 0 | 0 | Three-State | Three-State | PLL | Y |
| 0 | 1 | Driven | Three-State | PLL | N |
| 1 | 0 | Driven | Driven | Reference | Y |
| 1 | 1 | Driven | Driven | PLL | N |

## Available CY2308 Configurations

| Device | Feedback From | Bank A Frequency | Bank B Frequency |
| :--- | :--- | :--- | :--- |
| CY2308-1 | Bank A or Bank B | Reference | Reference |
| CY2308-1H | Bank A or Bank B | Reference | Reference |
| CY2308-2 | Bank A | Reference | Reference/2 |
| CY2308-2 | Bank B | $2 \times$ Reference | Reference |
| CY2308-3 | Bank A | $2 \times$ Reference | Reference or Reference ${ }^{[1]}$ |
| CY2308-3 | Bank B | $4 \times$ Reference | $2 \times$ Reference |
| CY2308-4 | Bank A or Bank B | $2 \times$ Reference | $2 \times$ Reference |
| CY2308-5H | Bank A or Bank B | Reference $/ 2$ | Reference $/ 2$ |

Note:

1. Output phase is indeterminant ( $0^{\circ}$ or $180^{\circ}$ from input clock). If phase integrity is required, use the CY2308-2.

## Zero Delay and Skew Control

## REF. Input to CLKA/CLKB Delay v/s Difference in Loading between FBK pin and CLKA/CLKB pins

Output Load Difference: FBK Load - CLKAKLKB Load (pF)

To close the feedback loop of the CY2308, the FBK pin can be driven from any of the eight available output pins. The output driving the FBK pin will be driving a total load of 7 pF plus any additional load that it drives. The relative loading of this output (with respect to the remaining outputs) can adjust the inputoutput delay. This is shown in the graph above.
For applications requiring zero input-output delay, all outputs including the one providing feedback should be equally load-
ed. If input-output delay adjustments are required, use the above graph to calculate loading differences between the feedback output and remaining outputs.
For zero output-output skew, be sure to load outputs equally. For further information on using CY2308, refer to the application note "CY2308: Zero Delay Buffer."

Pin Description

| Pin | Signal |  |
| :---: | :--- | :--- |
| 1 | REF $^{[2]}$ | Input reference frequency, 5V tolerant input |
| 2 | CLKA1 $^{[3]}$ | Clock output, Bank A |
| 3 | CLKA2 $^{[3]}$ | Clock output, Bank A |

## Maximum Ratings

Supply Voltage to Ground Potential $\qquad$ -0.5 V to +7.0 V
DC Input Voltage (Except Ref) -0.5 V to $\mathrm{V}_{\mathrm{DD}}+0.5 \mathrm{~V}$
DC Input Voltage REF $\qquad$ -0.5 to 7 V

## Notes

2. Weak pull-down.
. Weak pull-down on all outputs.
3. Weak pull-ups on these inputs.

Storage Temperature $\qquad$ $-65^{\circ} \mathrm{C}$ to $+150^{\circ} \mathrm{C}$
Junction Temperature $150^{\circ} \mathrm{C}$
Static Discharge Voltage (per MIL-STD-883, Method 3015). $\qquad$ >2000V
