

SY58603U

4.25Gbps Precision CML Buffer with Internal Termination and Fail Safe Input

General Description

The SY58603U is a 2.5/3.3V, high-speed, fully differential CML buffer optimized to provide less than 10ps_{pp} total jitter. The SY58603U can process clock signals as fast as 2.5GHz or data patterns up to 4.25Gbps.

The differential input includes Micrel's unique, 3-pin input termination architecture that interfaces to LVPECL, LVDS or CML differential signals, (AC-coupled or DC-coupled) as small as 100mV (200mV_{pp}) without any level-shifting or termination resistor networks in the signal path. For AC-coupled input interface applications, an integrated voltage reference (V_{REF-AC}) is provided to bias the V_T pin. The output is 400mV CML, with extremely fast rise/fall times guaranteed to be less than 85ps.

The SY58603U operates from a 2.5V $\pm 5\%$ supply or 3.3V $\pm 10\%$ supply and is guaranteed over the full industrial temperature range (-40°C to $+85^\circ\text{C}$). For applications that require LVPECL or LVDS outputs, consider the SY58604U and SY58605U, buffers with 800mV and 325mV output swings respectively. The SY58603U is part of Micrel's high-speed, Precision Edge[®] product line.

Precision Edge[®]

Features

- Precision 400mV CML buffer
- Guaranteed AC performance over temperature and voltage:
 - DC-to >4.25Gbps throughput
 - <300ps propagation delay (IN-to-Q)
 - <85ps rise/fall times
- Fail Safe Input
 - Prevents output from oscillating when input is invalid
- Ultra-low jitter design
 - <1ps_{RMS} cycle-to-cycle jitter
 - <10ps_{PP} total jitter
 - <1ps_{RMS} random jitter
 - <10ps_{PP} deterministic jitter
- High-speed CML output
- 2.5V $\pm 5\%$ or 3.3V $\pm 10\%$ power supply operation
- Industrial temperature range: -40°C to $+85^\circ\text{C}$
- Available in 8-pin (2mm x 2mm) MLF[®] package

Applications

- Data Distribution: OC-48, OC-48+FEC, XAUI
- Backplane Buffering
- SONET clock or data distribution
- Fibre Channel clock or data distribution
- Gigabit Ethernet clock or data distribution

Markets

- Storage
- ATE
- Test and measurement
- Enterprise networking equipment
- High-end servers
- Access
- Metro area network equipment

Pin Configuration

8-Pin MLF[®] (MLF-8)

Pin Description

Pin Number	Pin Name	Pin Function
1, 4	IN, /IN	Differential Input: This input pair is the differential signal input to the device. Input accepts DC-Coupled differential signals as small as 100mV (200mVpp). Each pin of this pair internally terminates with 50Ω to the VT pin. If the input swing falls below a certain threshold (typical 30mV), the Fail Safe Input (FSI) feature will guarantee a stable output by latching the output to its last valid state. See “Input Interface Applications” section for more details.
2	VT	Input Termination Center-Tap: Each side of the differential input pair terminates to VT pin. This pin provides a center-tap to a termination network for maximum interface flexibility. See “Input Interface Applications” section.
3	VREF-AC	Reference Voltage: This output biases to V _{CC} -1.2V. It is used for AC-coupling input IN and /IN. Connect VREF-AC directly to the corresponding VT pin. Bypass with 0.01μF low ESR capacitor to VCC. Maximum sink/source current is ±1.5mA. Please refer to the “Input Interface Applications” section for more details.
5	GND Exposed pad	Ground: Exposed pad must be connected to a ground plane that is the same potential as the ground pin.
6, 7	/Q, Q	CML Differential Output Pair: Differential buffered output copy of the input signal. The output swing is typically 400mV. See “CML Output Termination” section.
8	VCC	Positive Power Supply: Bypass with 0.1uF//0.01uF low ESR capacitors as close to the V _{CC} pin as possible.

Notes:

1. Permanent device damage may occur if absolute maximum ratings are exceeded. This is a stress rating only and functional operation is not implied at conditions other than those detailed in the operational sections of this data sheet. Exposure to absolute maximum ratings conditions for extended periods may affect device reliability.
2. The data sheet limits are not guaranteed if the device is operated beyond the operating ratings.
3. Package thermal resistance assumes exposed pad is soldered (or equivalent) to the device's most negative potential on the PCB. ψ_{JB} and θ_{JA} values are determined for a 4-layer board in still-air number, unless otherwise stated.
4. Due to the limited drive capability, use for input of the same package only.
5. The circuit is designed to meet the DC specifications shown in the above table after thermal equilibrium has been established.
6. V_{IN} (max) is specified when V_T is floating.
7. V_{IH} (min) not lower than 1.2V.

	Duty Cycle	Differential I/O	47		53	%

Notes:

- Part-to-part skew is defined for two parts with identical power supply voltages at the same temperature and no skew at the edges at the respective inputs.
- Random jitter is measured with a K28.7 pattern, measured at $\leq f_{MAX}$.
- Deterministic jitter is measured at 2.5Gbps with both K28.5 and $2^{23}-1$ PRBS pattern.
- Cycle-to-cycle jitter definition: the variation period between adjacent cycles over a random sample of adjacent cycle pairs. $t_{JITTER_CC} = T_n - T_{n+1}$, where T is the time between rising edges of the output signal.
- Total jitter definition: with an ideal clock input frequency of $\leq f_{MAX}$ (device), no more than one output edge in 10^{12} output edges will deviate by more than the specified peak-to-peak jitter value.

Functional Description

Fail-Safe Input (FSI)

The input includes a special failsafe circuit to sense the amplitude of the input signal and to latch the output when there is no input signal present, or when the amplitude of the input signal drops sufficiently below 100mV_{PK} (200mV_{PP}), typically 30mV_{PK} . Maximum frequency of SY58603U is limited by the FSI function.

Input Clock Failure Case

If the input clock fails to a floating, static, or extremely low signal swing, the FSI function will eliminate a metastable condition and guarantee a stable output. No ringing and no undetermined state will occur at the output under these conditions.

Note that the FSI function will not prevent duty cycle distortion in case of a slowly deteriorating (but still toggling) input signal. Due to the FSI function, the propagation delay will depend on rise and fall time of the input signal and on its amplitude. Refer to "Typical Characteristics" for detailed information.
