SY54011R

Low Voltage 1.2V/1.8V CML 1:2 Fanout Buffer, 3.2Gbps, 3.2GHz

General Description

The SY54011R is a fully differential, low voltage 1.2V/1.8V CML 1:2 fanout buffer. It is optimized to provide two identical output copies with less than 15ps of skew and less than $10ps_{pp}$ total jitter. The SY54011R can process clock signals as fast as 3.2GHz or data patterns up to 3.2Gbps.

The differential input includes Micrel's unique, 3-pin input termination architecture that interfaces to LVPECL, LVDS or CML differential signals, (AC- or DC-coupled from a 2.5V driver) as small as 100mV ($200mV_{PP}$) without any level-shifting or termination resistor networks in the signal path. For AC-coupled input interface applications, an integrated voltage reference (V_{REF-AC}) is provided to bias the VT pin. The outputs are CML, with extremely fast rise/fall times guaranteed to be less than 95ps.

The SY54011R operates from a 2.5V ±5% core supply and a 1.8V or 1.2V ±5% output supply and is guaranteed over the full industrial temperature range (–40°C to +85°C). The SY54011R is part of Micrel's high-speed, Precision Edge® product line.

Features

- 1.2V/1.8V CML 1:2 fanout buffer
- Guaranteed AC performance over temperature and voltage:
  - DC-to- > 3.2Gbps throughput
  - <300ps propagation delay (IN-to-Q)
  - <15ps within-device skew
  - <95ps rise/fall times
- Ultra-low jitter design
  - $<1ps_{RMS}$ cycle-to-cycle jitter
  - $<10ps_{PP}$ total jitter
  - $<1ps_{RMS}$ random jitter
  - $<10ps_{PP}$ deterministic jitter
- High-speed CML outputs
- 2.5V ±5% , 1.8/1.2V ±5% power supply operation
- Industrial temperature range: –40°C to +85°C
- Available in 16-pin (3mm x 3mm) MLF® package

Applications

- Data Distribution: OC-48, OC-48+FEC
- SONET clock and data distribution
- Fibre Channel clock and data distribution
- Gigabit Ethernet clock and data distribution

Markets

- Storage
- ATE
- Test and measurement
- Enterprise networking equipment
- High-end servers
- Access
- Metro area network equipment

Pin Description

Pin Number	Pin Name	Pin Function
1, 4	IN, /IN	Differential Input: This input pair is the differential signal input to the device. Input accepts differential signals as small as 100mV (200mV$_{PP}$). Each input pin internally terminates with 50Ω to the VT pin.
2	VT	Input Termination Center-Tap: Each side of the differential input pair terminates to VT pin. This pin provides a center-tap to a termination network for maximum interface flexibility. See “Interface Applications” subsection.
3	VREF-AC	Reference Voltage: This output biases to V_{CC}–1.15V. It is used for AC-coupling inputs IN and /IN. Connect VREF-AC directly to the VT pin. Bypass with 0.1µF low ESR capacitor to VCC. Maximum sink/source current is ±0.5mA. See “Input Interface Applications” subsection.
5, 16	VCC	Positive Power Supply: Bypass with 0.1uF//0.01uF low ESR capacitors as close to the V_{CC} pins as possible. Supplies input and core circuitry.
8,13	VCCO	Output Supply: Bypass with 0.1uF//0.01uF low ESR capacitors as close to the V_{CCO} pins as possible. Supplies the output buffers.
6, 7, 14, 15	GND, Exposed pad	Ground: Exposed pad must be connected to a ground plane that is the same potential as the ground pins.
10, 9 11, 12	/Q1, Q1 /Q0, Q0	CML Differential Output Pairs: Differential buffered copies of the input signal. The output swing is typically 390mV. See “Interface Applications” subsection for termination information.

Notes:

1. Permanent device damage may occur if absolute maximum ratings are exceeded. This is a stress rating only and functional operation is not implied at conditions other than those detailed in the operational sections of this data sheet. Exposure to absolute maximum ratings conditions for extended periods may affect device reliability.
2. The data sheet limits are not guaranteed if the device is operated beyond the operating ratings.
3. Package thermal resistance assumes exposed pad is soldered (or equivalent) to the device's most negative potential on the PCB. ψ_{JB} and θ_{JA} values are determined for a 4-layer board in still-air number, unless otherwise stated.
4. Due to the limited drive capability, use for input of the same package only.
5. The circuit is designed to meet the DC specifications shown in the above table after thermal equilibrium has been established.

Notes:

7. Within device skew is measured between two different outputs under identical input transitions.
8. Part-to-part skew is defined for two parts with identical power supply voltages at the same temperature and no skew at the edges at the respective inputs.
9. Random jitter is measured with a K28.7 pattern, measured at ≤ f_{MAX}.
10. Deterministic jitter is measured at 2.5Gbps with both K28.5 and 2^{23}–1 PRBS pattern.
11. Cycle-to-cycle jitter definition: the variation period between adjacent cycles over a random sample of adjacent cycle pairs. $t_{JITTER\_CC} = T_n - T_{n+1}$, where T is the time between rising edges of the output signal.
12. Total jitter definition: with an ideal clock input frequency of ≤ f_{MAX} (device), no more than one output edge in 10^{12} output edges will deviate by more than the specified peak-to-peak jitter value.

Interface Applications

For Input Interface Applications see Figures 4a-f and for CML Output Termination see Figures 5a-d.

CML Output Termination with VCCO 1.2V

For VCCO of 1.2V, Figure 5a, terminate the output with 50Ω-to-1.2V, DC-coupled, not 100Ω differentially across the outputs.

If AC-coupling is used, Figure 5d, terminate into 50Ω-to-1.2V before the coupling capacitor and then connect to a high value resistor to a reference voltage.

Do not AC couple with internally terminated receiver. For example, 50Ω ANY-IN input. AC-coupling will offset the output voltage by 200mV and this offset voltage will be too low for proper driver operation.

Any unused output pair needs to be terminated when VCCO is 1.2V, do not leave floating.

CML Output Termination with VCCO 1.8V

For VCCO of 1.8V, Figure 5a and Figure b, terminate with either 50Ω-to-1.8V or 100Ω differentially across the outputs. AC- or DC-coupling is fine.

Input AC Coupling

The SY54011R input can accept AC coupling from any driver. Tie VT to VREF-AC and bypass with a 0.1µF capacitor as shown in Figures 4c and 4d.
