

## High Speed Multifrequency PLL Clock Buffer

### Features

- 12–100 MHz (CY7B9930V), or 24–200 MHz (CY7B9940V) input/output operation
- Matched pair output skew < 200 ps
- Zero input-to-output delay
- 10 LVTTTL 50% duty-cycle outputs capable of driving 50Ω terminated lines
- Commercial temperature range with eight outputs at 200 MHz
- Industrial temperature range with eight outputs at 200 MHz
- 3.3V LVTTTL/LV differential (LVPECL), fault-tolerant and hot insertable reference inputs
- Multiply ratios of (1–6, 8, 10, 12)
- Operation up to 12x input frequency
- Individual output bank disable for aggressive power management and EMI reduction
- Output high impedance option for testing purposes
- Fully integrated PLL with lock indicator
- Low cycle-to-cycle jitter (<100 ps peak-peak)

- Single 3.3V ± 10% supply

- 44-pin TQFP package

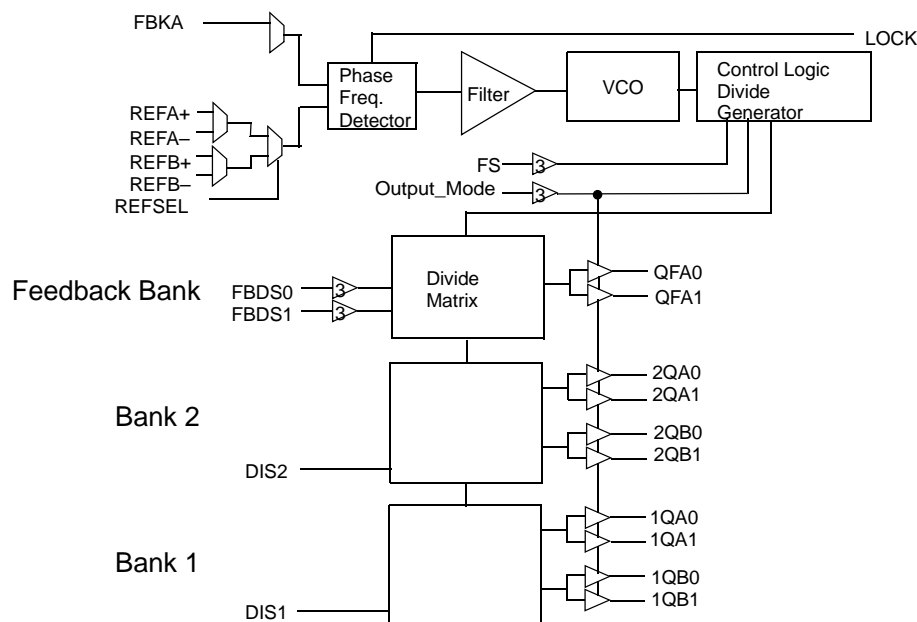

### Functional Description

The CY7B9930V and CY7B9940V High-Speed Multifrequency PLL Clock Buffers offer user-selectable control over system clock functions. This multiple output clock driver provides the system integrator with functions necessary to optimize the timing of high performance computer or communication systems.

Ten configurable outputs can each drive terminated transmission lines with impedances as low as 50Ω while delivering minimal and specified output skews at LVTTTL levels. The outputs are arranged in three banks. The FB feedback bank consists of two outputs, which allows divide-by functionality from 1 to 12. Any one of these ten outputs can be connected to the feedback input as well as driving other inputs.

Selectable reference input is a fault tolerance feature that allows smooth change over to secondary clock source, when the primary clock source is not in operation. The reference inputs are configurable to accommodate both LVTTTL or differential (LVPECL) inputs. The completely integrated PLL reduces jitter and simplifies board layout.

### Block Diagram

## Block Diagram Description

### Phase Frequency Detector and Filter

These two blocks accept signals from the REF inputs (REFA+, REFA-, REFB+ or REFB-) and the FB input (FBKA). Correction information is then generated to control the frequency of the Voltage Controlled Oscillator (VCO). These two blocks, along with the VCO, form a Phase-Locked Loop (PLL) that tracks the incoming REF signal.

The RoboClockII™ Junior has a flexible REF input scheme. These inputs allow the use of either differential LVPECL or single ended LVTTTL inputs. To configure as single ended LVTTTL inputs, leave the complementary pin to 1.5V), then use the other input pin as an LVTTTL input. The REF inputs are also tolerant to hot insertion.

The REF inputs can be changed dynamically. When changing from one reference input to the other reference input of the same frequency, the PLL is optimized to ensure that the clock outputs period is not less than the calculated system budget ( $t_{MIN} = t_{REF}$  (nominal reference clock period) -  $t_{CCJ}$  (cycle-to-cycle jitter) -  $t_{PDEV}$  (max. period deviation)) while reacquiring lock.

### VCO, Control Logic, and Divide Generator

The VCO accepts analog control inputs from the PLL filter block. The FS control pin setting determines the nominal operational frequency range of the divide by one output ( $f_{NOM}$ ) of the device.  $f_{NOM}$  is directly related to the VCO frequency. There are two versions of the RoboClockII Junior, a low speed device (CY7B9930V) where  $f_{NOM}$  ranges from 12 MHz to 100 MHz, and a high speed device (CY7B9940V), which ranges from 24 MHz to 200 MHz. The FS setting for each device is shown in Table 1. The  $f_{NOM}$  frequency is seen on “divide-by-one” outputs.

**Table 1. Frequency Range Select**

FS <sup>[1]</sup>	CY7B9930V		CY7B9940V	
	f <sub>NOM</sub> (MHz)		f <sub>NOM</sub> (MHz)	
	Min.	Max.	Min.	Max.
LOW	12	26	24	52
MID	24	52	48	100
HIGH	48	100	96	200 <sup>[2]</sup>

#### Notes

- The level to be set on FS is determined by the “nominal” operating frequency ( $f_{NOM}$ ) of the VCO.  $f_{NOM}$  always appears on an output when the output is operating in the undivided mode. The REF and FB are at  $f_{NOM}$  when the output connected to FB is undivided.
- The maximum output frequency is 200 MHz.

## Divide Matrix

The Divide Matrix is comprised of three independent banks: two banks of clock outputs and one bank for feedback. Each clock output bank has two pairs of low-skew, high fanout output buffers ([1:2]Q[A:B][0:1]), and an output disable (DIS[1:2]).

The feedback bank has one pair of low-skew, high fanout output buffers (QFA[0:1]). One of these outputs may connect to the selected feedback input (FBKA+). This feedback bank also has two divider function selects FBDS[0:1].

The divide capabilities for each bank are shown in Table 2.

**Table 2. Output Divider Function**

Function Selects		Output Divider Function		
FBDS1	FBDS0	Bank 1	Bank 2	Feedback Bank
LOW	LOW	/1	/1	/1
LOW	MID	/1	/1	/2
LOW	HIGH	/1	/1	/3
MID	LOW	/1	/1	/4
MID	MID	/1	/1	/5
MID	HIGH	/1	/1	/6
HIGH	LOW	/1	/1	/8
HIGH	MID	/1	/1	/10
HIGH	HIGH	/1	/1	/12

## Output Disable Description

The outputs of Bank 1 and Bank 2 can be independently put into a HOLD OFF or high impedance state. The combination of the Output\_Mode and DIS[1:2] inputs determines the clock outputs' state for each bank. When the DIS[1:2] is LOW, the outputs of the corresponding bank are enabled. When the DIS[1:2] is HIGH, the outputs for that bank are disabled to a high impedance (HI-Z) or HOLD OFF state depending on the Output\_Mode input. Table 3 defines the disabled output functions.

The HOLD OFF state is designed as a power saving feature. An output bank is disabled to the HOLD OFF state in a maximum of six output clock cycles from the time when the disable input (DIS[1:2]) is HIGH. When disabled to the HOLD OFF state, outputs are driven to a logic LOW state on its falling edge. This ensures the output clocks are stopped without glitch. When a bank of outputs is disabled to HI-Z state, the respective bank of outputs go HI-Z immediately.

**Table 3. DIS[1:2] Pin Functionality**

OUTPUT_MODE	DIS[1:2]/FBDIS	Output Mode
HIGH/LOW	LOW	ENABLED
HIGH	HIGH	HI-Z
LOW	HIGH	HOLD-OFF
MID	X	FACTORY TEST

### Lock Detect Output Description

The LOCK detect output indicates the lock condition of the integrated PLL. Lock detection is accomplished by comparing the phase difference between the reference and feedback inputs. Phase error is declared when the phase difference between the two inputs is greater than the specified device propagation delay limit ( $t_{PD}$ ).

When in the locked state, after four or more consecutive feedback clock cycles with phase errors, the LOCK output is forced LOW to indicate out-of-lock state.

When in the out-of-lock state, 32 consecutive phase errorless feedback clock cycles are required to allow the LOCK output to indicate lock condition (LOCK = HIGH).

If the feedback clock is removed after LOCK has gone HIGH, a Watchdog circuit is implemented to indicate the out-of-lock condition after a timeout period by deasserting LOCK LOW. This timeout period is based upon a divided down reference clock.

This assumes that there is activity on the selected REF input. If there is no activity on the selected REF input then the LOCK detect pin may not accurately reflect the state of the internal PLL.

### Factory Test Mode Description

The device enters factory test mode when the OUTPUT\_MODE is driven to MID. In factory test mode, the device operates with its internal PLL disconnected; the input level supplied to the reference input is used in place of the PLL output. In TEST mode the selected FB input must be tied LOW. All functions of the device remain operational in factory test mode except the internal PLL and output bank disables. The OUTPUT\_MODE input is designed as a static input. Dynamically toggling this input from LOW to HIGH may temporarily cause the device to go into factory test mode (when passing through the MID state).

#### Factory Test Reset

When in factory test mode (OUTPUT\_MODE = MID), the device is reset to a deterministic state by driving the DIS2 input HIGH. When the DIS2 input is driven HIGH in factory test mode, all clock outputs go to HI-Z; after the selected reference clock pin has five positive transitions, all the internal finite state machines (FSM) are set to a deterministic state. The deterministic state of the state machines depends on the configurations of the divide selects and frequency select input. All clock outputs stay in high impedance mode and all FSMs stay in the deterministic state until DIS2 is deasserted. When DIS2 is deasserted (with OUTPUT\_MODE still at MID), the device reenters factory test mode.

## Pin Definitions

Name	I/O	Type	Description
FBKA	Input	LVTTL	<b>Feedback Input.</b>
REFA+, REFA-, REFB+, REFB-	Input	LVTTL/ LVDIFF	<b>Reference Inputs:</b> These inputs operate as either differential PECL or single ended TTL reference inputs to the PLL. When operating as a single ended LVTTL input, leave the complementary input must be left open.
REFSEL	Input	LVTTL	<b>Reference Select Input:</b> The REFSEL input controls reference input configuration. When LOW, it uses the REFA pair as the reference input. When HIGH, it uses the REFB pair as the reference input. This input has an internal pull down.
FS <sup>[3]</sup>	Input	3 Level Input	<b>Frequency Select:</b> Set this input according to the nominal frequency ( $f_{NOM}$ ). See <a href="#">Table 1</a> .
FBDS[0:1] <sup>[3]</sup>	Input	3 Level Input	<b>Feedback Divider Function Select.</b> These inputs determine the function of the QFA0 and QFA1 outputs. See <a href="#">Table 2</a> .
DIS[1:2]	Input	LVTTL	<b>Output Disable:</b> Each input controls the state of the respective output bank. When HIGH, the output bank is disabled to the "HOLD OFF" or "HI-Z" state; the disable state is determined by OUTPUT_MODE. When LOW, the [1:4]Q[A:B][0:1] is enabled. See <a href="#">Table 3</a> . These inputs each have an internal pull down.
LOCK	Output	LVTTL	<b>PLL Lock Indicator:</b> When HIGH, this output indicates that the internal PLL is locked to the reference signal. When LOW, the PLL is attempting to acquire lock.
Output_Mode <sup>[3]</sup>	Input	3 Level Input	<b>Output Mode:</b> This pin determines the clock outputs' disable state. When this input is HIGH, the clock outputs disable to high impedance (HI-Z). When this input is LOW, the clock outputs disables to "HOLD OFF" mode. When in MID, the device enters factory test mode.
QFA[0:1]	Output	LVTTL	<b>Clock Feedback Output:</b> This pair of clock outputs connects to the FB input. These outputs have numerous divide options. The function is determined by the setting of the FBDS[0:1] pins.
[1:2]Q[A:B][0:1]	Output	LVTTL	<b>Clock Output.</b>
VCCN		PWR	<b>Output Buffer Power:</b> Power supply for each output pair.
VCCQ		PWR	<b>Internal Power:</b> Power supply for the internal circuitry.
GND		PWR	<b>Device Ground.</b>

### Note

3. For all tri-state inputs, HIGH indicates a connection to  $V_{CC}$ , LOW indicates a connection to GND, and MID indicates an open connection. Internal termination circuitry holds an unconnected input to  $V_{CC}/2$ .

## Absolute Maximum Conditions

Exceeding the maximum ratings may impair the useful life of the device. These user guidelines are not tested.

Storage temperature ..... -40°C to +125°C  
 Ambient Temperature with power applied ..... -40°C to +125°C  
 Supply voltage to ground potential ..... -0.5V to +4.6V  
 DC input voltage ..... -0.3V to  $V_{CC}+0.5V$   
 Output current into outputs (LOW) ..... 40 mA

Static discharge voltage..... >2000V  
 MIL-STD-883, Method 3015)

Latch up current..... >±200 mA

## Operating Range

Range	Ambient Temperature	$V_{CC}$
Commercial	0°C to +70°C	3.3V ±10%
Industrial	-40°C to +85°C	3.3V ±10%

## Electrical Characteristics Over the Operating Range

$I_{IMM}$	Three level input MID current	Three level input pins	$V_{IN} = V_{CC}/2$	-50	50	μA
$I_{ILL}$	Three level input LOW current	Three level input pins	$V_{IN} = \text{GND}$	-200	-	μA
<b>LVDIFF Input Pins (REF[A:B]±)</b>						
$V_{DIFF}$	Input differential voltage			400	$V_{CC}$	mV
$V_{IHHP}$	Highest input HIGH voltage			1.0	$V_{CC}$	V
$V_{ILLP}$	Lowest input LOW voltage			GND	$V_{CC} - 0.4$	V
$V_{COM}$	Common mode range (crossing voltage)			0.8	$V_{CC}$	V

### Note

4. These inputs are normally wired to  $V_{CC}$ , GND, or left unconnected (actual threshold voltages vary as a percentage of  $V_{CC}$ ). Internal termination resistors hold the unconnected inputs at  $V_{CC}/2$ . If these inputs are switched, the function and timing of the outputs may glitch and the PLL may require an additional  $t_{LOCK}$  time before all data sheet limits are achieved.

t <sub>PDDELTA</sub>	Propagation delay difference between two devices <sup>[14]</sup>		–	200		200	ps
t <sub>REFpwh</sub>	REF input (pulse width HIGH) <sup>[15]</sup>		2.0	–	2.0	–	ns
t <sub>REFpwl</sub>	REF input (pulse width LOW) <sup>[15]</sup>		2.0	–	2.0	–	ns
t <sub>r</sub> /t <sub>f</sub>	Output rise/fall time <sup>[16]</sup>		0.15	2.0	0.15	2.0	ns

**Notes**

- I<sub>CCI</sub> measurement is performed with Bank1 and FB Bank configured to run at maximum frequency (f<sub>NOM</sub> = 100 MHz for CY7B9930V, f<sub>NOM</sub> = 200 MHz for CY7B9940V), and all other clock output banks to run at half the maximum frequency. FS and OUTPUT\_MODE are asserted to the HIGH state.
- This is dependent upon frequency and number of outputs of a bank being loaded. The value indicates maximum I<sub>CCN</sub> at maximum frequency and maximum load of 25 pF terminated to 50Ω at V<sub>CC</sub>/2.
- This is for non-three level inputs.
- Assumes 25 pF Max. Load Capacitance up to 185 Mhz. At 200 MHz the max load is 10 pF.
- Both outputs of pair must be terminated, even if only one is being used.
- Each package must be properly decoupled.
- AC parameters are measured at 1.5V, unless otherwise indicated.
- Test Load C<sub>L</sub> = 25 pF, terminated to V<sub>CC</sub>/2 with 50Ω.
- SKEW is defined as the time between the earliest and the latest output transition among all outputs for which the same phase delay has been selected when all outputs are loaded with 25 pF and properly terminated up to 185 MHz. At 200 MHz the max load is 10 pF.
- Guaranteed by statistical correlation. Tested initially and after any design or process changes that may affect these parameters.
- Tested initially and after any design or process changes that may affect these parameters.
- Rise and fall times are measured between 2.0V and 0.8V.

## Switching Characteristics

Over the Operating Range<sup>[7, 8, 9, 10, 11]</sup> (continued)

Parameter	Description	CY7B9930/40V-2		CY7B9930/40V-5		Unit
		Min.	Max.	Min.	Max.	
$t_{\text{LOCK}}$	PLL lock time from power up	–	10	–	10	ms
$t_{\text{RELOCK1}}$	PLL relock time (from same frequency, different phase) with stable power supply	–	500	–	500	$\mu\text{s}$

## AC Test Loads and Waveform

See note. [22]

(a) LVTTTL AC Test Load

(b) TTL Input Test Waveform

### Notes

17.  $f_{\text{NOM}}$  must be within the frequency range defined by the same FS state.
18.  $t_{\text{PWH}}$  is measured at 2.0V.  $t_{\text{PWL}}$  is measured at 0.8V.
19. UI = Unit Interval. Examples: 1 UI is a full period. 0.1 UI is 10% of period.
20. Measured at 0.5V deviation from starting voltage.
21. For  $t_{\text{OZA}}$  minimum,  $C_L = 0$  pF. For  $t_{\text{OZA}}$  maximum,  $C_L = 25$  pF to 18 MHz, 10 pF from 185 to 200 MHz.
22. These figures are for illustration only. The actual ATE loads may vary.

Disclaimer: CYPRESS MAKES NO WARRANTY OF ANY KIND, EXPRESS OR IMPLIED, WITH REGARD TO THIS MATERIAL, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. Cypress reserves the right to make changes without further notice to the materials described herein. Cypress does not assume any liability arising out of the application or use of any product or circuit described herein. Cypress does not authorize its products for use as critical components in life-support systems where a malfunction or failure may reasonably be expected to result in significant injury to the user. The inclusion of Cypress' product in a life-support systems application implies that the manufacturer assumes all risk of such use and in doing so indemnifies Cypress against all charges.

Use may be limited by and subject to the applicable Cypress software license agreement.
