## DESCRIPTION

The SY100EP111U is a high-speed, low skew 1-to-10 differential fanout buffer designed for clock distribution in new, high-performance systems. The internal 2:1 mux allows the input to select between two differential clock sources.

The device is specifically designed for low skew. The interconnect scheme and metal layout are carefully optimized for minimal gate-to-gate skew within the device. Wafer characterization and process control ensure consistent distribution of propagation delay from lot to lot.

The  $V_{BB}$  output is intended for use as a reference voltage for single-ended reception of ECL signals to that device only. When using  $V_{BB}$  for this purpose, it is recommended that  $V_{BB}$  is decoupled to  $V_{CC}$  via a  $0.01\mu\text{F}$  capacitor.
