

## GENERAL DESCRIPTION

The ICS8701 is a low skew,  $\div 1$ ,  $\div 2$  LVCMOS/LVTTL Clock Generator and a member of the HiPerClockS™ family of High Performance Clock Solutions from ICS. The low impedance LVCMOS outputs are designed to drive 50Ω series or parallel terminated transmission lines. The effective fanout can be increased from 20 to 40 by utilizing the ability of the outputs to drive two series terminated lines.

The divide select inputs, DIV\_SELx, control the output frequency of each bank. The outputs can be utilized in the  $\div 1$ ,  $\div 2$  or a combination of  $\div 1$  and  $\div 2$  modes. The bank enable inputs, BANK\_EN0:1, support enabling and disabling each bank of outputs individually. The master reset input, nMR/OE, resets the internal frequency dividers and also controls the active and high impedance states of all outputs.

The ICS8701 is characterized at 3.3V and mixed 3.3V input supply, and 2.5V output supply operating modes. Guaranteed bank, output and part-to-part skew characteristics make the ICS8701 ideal for those clock distribution applications demanding well defined performance and repeatability.

## FEATURES

- Twenty LVCMOS outputs, 7Ω typical output impedance
- One LVCMOS/LVTTL clock input
- Maximum output frequency: 250MHz
- Bank enable logic allows unused banks to be disabled in reduced fanout applications
- Output skew: 250ps (maximum)
- Part-to-part skew: 600ps (maximum)
- Bank skew: 200ps (maximum)
- Multiple frequency skew: 300ps (maximum)
- 3.3V or mixed 3.3V input, 2.5V output operating supply modes
- 0°C to 70°C ambient operating temperature
- Other divide values available on request
- Available in both standard and lead-free RoHS compliant packages

All parameters measured at 200MHz unless noted otherwise.

NOTE 1: Measured from the  $V_{DD}/2$  of the input to  $V_{DDO}/2$  of the output.

NOTE 2: Defined as skew within a bank of outputs at the same supply voltages and with equal load conditions.

NOTE 3: Defined as skew between outputs at the same supply voltage and with equal load conditions.

Measured at  $V_{DDO}/2$ .

NOTE 4: Defined as skew across banks of outputs operating at different frequency with the same supply voltages and equal load conditions.

NOTE 5: Defined as skew between outputs on different devices operating at the same supply voltages and with equal load conditions. Using the same type of inputs on each device, the outputs are measured at  $V_{DDO}/2$ .

NOTE 6: These parameters are guaranteed by characterization. Not tested in production.

NOTE 7: This parameter is defined in accordance with JEDEC Standard 65.

### RECOMMENDATIONS FOR UNUSED INPUT AND OUTPUT PINS

#### INPUTS:

##### LVCMOS CONTROL PINS:

All control pins have internal pull-ups or pull-downs; additional resistance is not required but can be added for additional protection. A 1k $\Omega$  resistor can be used.

#### OUTPUTS:

##### LVCMOS OUTPUT:

All unused LVCMOS output can be left floating. We recommend that there is no trace attached.
