

## 16-Bit, Ultra-Low Power, Voltage-Output Digital-to-Analog Converter

### FEATURES

- **16-Bit Resolution**
- **2.7 V to 5.5 V Single-Supply Operation**
- **Very Low Power: 15  $\mu$ W for 3 V Power**
- **High Accuracy, INL: 1 LSB**
- **Low Noise: 18n V/ $\sqrt{\text{Hz}}$**
- **Fast Settling: 1.0  $\mu$ S**
- **Fast SPI™ Interface, up to 50 MHz**
- **Reset to Mid-Code**
- **Schmitt-Trigger Inputs for Direct Optocoupler Interface**

### APPLICATIONS

- **Portable Equipment**
- **Automatic Test Equipment**
- **Industrial Process Control**
- **Data Acquisition Systems**
- **Optical Networking**

### DESCRIPTION

The DAC8832 is a single, 16-bit, serial-input, voltage-output digital-to-analog converter (DAC) operating from a single 3 V to 5 V power supply. The DAC8832 provides excellent linearity (1 LSB INL), low glitch, low noise, and fast settling (1.0  $\mu$ S to 1/2 LSB of full-scale output) over the specified temperature range of  $-40^{\circ}\text{C}$  to  $+85^{\circ}\text{C}$ . The output is unbuffered, which reduces the power consumption and the error introduced by the buffer.

This device features a standard high-speed (clock up to 50MHz), 3 V or 5 V SPI serial interface to communicate with a DSP or microprocessor.

The DAC8832 provides unipolar or bipolar output ( $\pm V_{\text{REF}}$ ) when working with an external buffer, and is reset to mid-code after power-up. For optimum performance, a set of Kelvin connections to the external reference and the analog ground input are provided.

The DAC8832 is available in a QFN-14 package, and is pin-to-pin compatible with the DAC8831IRGY, which is reset to zero code after power-up.

**Functional Block Diagram**

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

SPI, QSPI are trademarks of Motorola, Inc.  
Microwire is a trademark of National Semiconductor Corp.  
All other trademarks are the property of their respective owners.

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

### ORDERING INFORMATION<sup>(1)</sup>

PRODUCT	MINIMUM RELATIVE ACCURACY (LSB)	DIFFERENTIAL NONLINEARITY (LSB)	POWER-ON RESET VALUE	SPECIFIED TEMPERATURE RANGE	PACKAGE MARKING	PACKAGE-LEAD	PACKAGE DESIGNATOR	ORDERING NUMBER	TRANSPORT MEDIA, QUANTITY

## PIN CONFIGURATION (NOT TO SCALE)

NOTE: (1) Exposed thermal pad must be connected to analog ground.

## TERMINAL FUNCTIONS

TERMINAL		DESCRIPTION
NO.	NAME	
1	RFB	Feedback resistor. Connect to the output of external operational amplifier in bipolar mode.
2	V <sub>OUT</sub>	Analog output of DAC
3	AGNDF	Analog ground (Force)
4	AGNDS	Analog ground (Sense)
5	V <sub>REF-S</sub>	Voltage reference input (Sense). Connect to external voltage reference
6	V <sub>REF-F</sub>	Voltage reference input (Force). Connect to external voltage reference
7	$\overline{\text{CS}}$	Chip select input (active low). Data are not clocked into SDI unless $\overline{\text{CS}}$ is low.
8	SCLK	Serial clock input.
9	NC	No internal connection
10	SDI	Serial data input. Data are latched into input register on the rising edge of SCLK.
11	$\overline{\text{LDAC}}$	Load DAC control input. Active low. When $\overline{\text{LDAC}}$ is Low, the DAC latch is simultaneously updated with the content of the input register.
12	DGND	Digital ground
13	INV	Junction point of internal scaling resistors. Connect to external operational amplifier inverting input in bipolar mode.
14	V <sub>DD</sub>	Analog power supply, +3 V to +5 V.

## THEORY OF OPERATION

### GENERAL DESCRIPTION

The DAC8832 is a single, 16-bit, serial-input, voltage-output DAC. It operates from a single supply ranging from 2.7 V to 5 V, and typically consumes 5  $\mu$ A. Data are written to this device in a 16-bit word format, via an SPI serial interface. To ensure a known power-up state, the DAC8832 is designed with a power-on reset function. The DAC8832 is reset to mid-scale code. In unipolar mode, the DAC8832 is reset to  $1/2 \times V_{REF}$ , and in bipolar mode, is reset to 0 V. Kelvin sense connections for the reference and analog ground are also included.

### DIGITAL-TO-ANALOG SECTIONS

The DAC architecture consists of two matched DAC sections and is segmented. A simplified circuit diagram is shown in Figure 43. The four MSBs of the 16-bit data word are decoded to drive 15 switches, E1 to E15. Each of these switches connects one of 15 matched resistors to either AGND or  $V_{REF}$ . The remaining 12 bits of the data word drive switches S0 to S11 of a 12-bit voltage mode R-2R ladder network.

Figure 43. DAC Architecture

### OUTPUT RANGE

The output of the DAC is:

$$V_{OUT} = (V_{REF} \times Code) / 65536$$

Where *Code* is the decimal data word loaded to the DAC latch.

## POWER-ON RESET

The DAC8832 has a power-on reset function to ensure the output is at a known state upon power-up. Upon power-up, the DAC latch and input register contain mid-scale code until new data are loaded from the input serial shift register. Therefore, after power-up, the output from pin  $V_{OUT}$  is  $0.5 \times V_{REF}$  in unipolar mode, and 0 V in bipolar mode.

However, the serial register is not cleared on power-up, so its contents are undefined. When loading data initially to the device, 16 bits or more should be loaded to prevent erroneous data appearing on the output. If more than 16 bits are loaded, the last 16 are kept; if less than 16 are loaded, bits will remain from the previous word. If the device must be interfaced with data shorter than 16 bits, the data should be padded with 0s at the LSBs.

## SERIAL INTERFACE

The digital interface is standard 3-wire connection compatible with SPI, QSPI™, Microwire™, and TI DSP interfaces, which can operate at speeds up to 50 M-bits/sec. The data transfer is framed by  $\overline{CS}$ , the chip select signal. The DAC works as a bus slave. The bus master generates the synchronize clock, SCLK, and initiates the transmission. When  $\overline{CS}$  is high, the DAC is not accessed, and the clock SCLK and serial input data SDI are ignored. The bus master accesses the DAC by driving pin  $\overline{CS}$  low. Immediately following the high-to-low transition of  $\overline{CS}$ , the serial input data on pin SDI is shifted out from the bus master synchronously on the falling edge of SCLK, and latched on the rising edge of SCLK into the input shift register, MSB first. The low-to-high transition of  $\overline{CS}$  transfers the contents of the input shift register to the input register. All data registers are 16-bit. It takes 16 clocks of SCLK to transfer one data word to the parts. To complete a whole data word,  $\overline{CS}$  must go high immediately after 16 SCLKs are clocked in. If more than 16 SCLKs are applied during the low state of  $\overline{CS}$ , the last 16 bits are transferred to the input register on the rising edge of  $\overline{CS}$ . However, if  $\overline{CS}$  is not kept low during the entire 16 SCLK cycles, the data are corrupted. In this case, reload the DAC with a new 16-bit word.

The DAC8832 has an  $\overline{LDAC}$  pin allowing the DAC latch to be updated asynchronously by bringing  $\overline{LDAC}$  low after  $\overline{CS}$  goes high. In this case,  $\overline{LDAC}$  must be maintained high while  $\overline{CS}$  is low. If  $\overline{LDAC}$  is tied permanently low, the DAC latch is updated immediately after the input register is loaded (caused by the low-to-high transition of  $\overline{CS}$ ).

## APPLICATION INFORMATION

### UNIPOLAR OUTPUT OPERATION

The DAC8832 is capable of driving unbuffered loads of 60 kΩ. Unbuffered operation results in low supply current (typically 5 μA) and a low offset error. The DAC8832 can be configured to output both unipolar and bipolar voltages. Figure 44 shows a typical unipolar output voltage circuit. The code table for this mode of operation is shown in Table 1.

Figure 44. Unipolar Output Mode

Table 1. Unipolar Code

DAC LATCH CONTENTS		ANALOG OUTPUT
MSB	LSB	
1111	1111 1111 1111	$V_{REF} \times (65,535/65,536)$
1000	0000 0000 0000	$V_{REF} \times (32,768/65,536) = 1/2 V_{REF}$
0000	0000 0000 0001	$V_{REF} \times (1/65,536)$
0000	0000 0000 0000	0 V

Assuming a perfect reference, the worst-case output voltage may be calculated in the following equation:

**Unipolar Mode Worst-Case Output:**

$$V_{OUT\_UNI} = \frac{D}{2^{16}} \times (V_{REF} + V_{GE}) + V_{ZSE} + INL$$

Where:

$V_{OUT\_UNI}$  = Unipolar mode worst-case output

D = Code loaded to DAC

$V_{REF}$  = Reference voltage applied to part

$V_{GE}$  = Gain error in volts

$V_{ZSE}$  = Zero scale error in volts

INL = Integral nonlinearity in volts

### BIPOLAR OUTPUT OPERATION

With the aid of an external operational amplifier, the DAC8832 may be configured to provide a bipolar voltage output. A typical circuit of such an operation is shown in Figure 45. The matched bipolar offset resistors  $R_{FB}$  and  $R_{INV}$  are connected to an external operational amplifier to achieve this bipolar output swing; typically,  $R_{FB} = R_{INV} = 28\text{ k}\Omega$ .

Figure 45. Bipolar Output Mode

Table 2 shows the transfer function for this output operating mode. The DAC8832 also provides a set of Kelvin connections to the analog ground and external reference inputs.

Table 2. Bipolar Code

DAC LATCH CONTENTS		ANALOG OUTPUT
MSB	LSB	
1111 1111	1111 1111	$+V_{REF} \times (32,767/32,768)$
1000 0000	0000 0001	$+V_{REF} \times (1/32,768)$
1000 0000	0000 0000	0 V
0111 1111	1111 1111	$-V_{REF} \times (1/32,768)$
0000 0000	0000 0000	$-V_{REF} \times (32,768/32,768) = -V_{REF}$

Assuming a perfect reference, the worst-case output voltage may be calculated from the following equation:

**Bipolar Mode Worst-Case Output:**

$$V_{OUT\_BIP} = \frac{\left[ (V_{OUT\_UNI} + V_{OS}) (2 + RD) - V_{REF}(1 + RD) \right]}{1 + \left( \frac{2 + RD}{A} \right)}$$

Where:

- $V_{OS}$  = External operational amplifier input offset voltage
- $RD = R_{FB}$  and  $R_{IN}$  resistor matching error
- $A$  = Operational amplifier open-loop gain

## OUTPUT AMPLIFIER SELECTION

For bipolar mode, a precision amplifier should be used, supplied from a dual power supply. This provides the  $\pm V_{REF}$  output.

In a single-supply application, selection of a suitable operational amplifier may be more difficult because the output swing of the amplifier does not usually include the negative rail; in this case, AGND. This output swing can result in some degradation of the specified performance unless the application does not use codes near 0.

The selected operational amplifier needs to have low-offset voltage (the DAC LSB is 38  $\mu$ V with a 2.5 V reference), eliminating the need for output offset trims. Input bias current should also be low because the bias current multiplied by the DAC output impedance (approximately 6.25 k $\Omega$ ) adds to the zero-code error.

Rail-to-rail input and output performance are required. For fast settling, the slew rate of the operational amplifier should not impede the settling time of the DAC. Output impedance of the DAC is constant and code-independent, but in order to minimize gain errors the input impedance of the output amplifier should be as high as possible. The amplifier should also have a 3 dB bandwidth of 1 MHz or greater. The amplifier adds another time constant to the system, thus increasing the settling time of the output. A higher 3 dB amplifier bandwidth results in a shorter effective settling time of the combined DAC and amplifier.

## REFERENCE AND GROUND

Since the input impedance is code-dependent, the reference pin should be driven from a low impedance source. The DAC8832 operates with a voltage reference ranging from 1.25 V to  $V_{DD}$ . References below 1.25 V result in reduced accuracy.

The DAC full-scale output voltage is determined by the reference. [Table 1](#) and [Table 2](#) outline the analog output voltage for particular digital codes.

For optimum performance, Kelvin sense connections are provided. If the application does not require separate force and sense lines, they should be tied together close to the package to minimize voltage drops between the package leads and the internal die.

## POWER SUPPLY AND REFERENCE BYPASSING

For accurate high-resolution performance, it is recommended that the reference and supply pins be bypassed with a 10  $\mu$ F tantalum capacitor in parallel with a 0.1  $\mu$ F ceramic capacitor.

<sup>(1)</sup> The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

<sup>(2)</sup> Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

**TBD:** The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

**Green (RoHS & no Sb/Br):** TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

<sup>(3)</sup> MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

**Important Information and Disclaimer:**The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

RGY (S-PQFP-N14)

PLASTIC QUAD FLATPACK

- NOTES:
- A. All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M-1994.
  - B. This drawing is subject to change without notice.
  - C. QFN (Quad Flatpack No-Lead) package configuration.
  - The package thermal pad must be soldered to the board for thermal and mechanical performance.
  - Pin 1 identifiers are located on both top and bottom of the package and within the zone indicated. The Pin 1 identifiers are either a molded, marked, or metal feature.
  - F. Package complies to JEDEC MO-241 variation BA.

THERMAL INFORMATION

This package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB). After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For information on the Quad Flatpack No-Lead (QFN) package and its advantages, refer to Application Report, Quad Flatpack No-Lead Logic Packages, Texas Instruments Literature No. SCBA017. This document is available at [www.ti.com](http://www.ti.com).

The exposed thermal pad dimensions for this package are shown in the following illustration.

Bottom View

NOTE: All linear dimensions are in millimeters

Exposed Thermal Pad Dimensions

RGY (R-PQFP-N14)

- NOTES:
- A. All linear dimensions are in millimeters.
  - B. This drawing is subject to change without notice.
  - C. Publication IPC-7351 is recommended for alternate designs.
  - D. This package is designed to be soldered to a thermal pad on the board. Refer to Application Note, Quad Flat-Pack Packages, Texas Instruments Literature No. SCBA017, SLUA271, and also the Product Data Sheets for specific thermal information, via requirements, and recommended board layout. These documents are available at [www.ti.com](http://www.ti.com) <<http://www.ti.com>>.
  - E. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC 7525 for stencil design considerations.
  - F. Customers should contact their board fabrication site for minimum solder mask web tolerances between signal pads.

## IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
