### applications

- **Battery-Powered Test Instruments**
- **Digital Offset and Gain Adjustment**
- **Industrial Process Controls**
- **Machine and Motion Control Devices**
- **Communications**
- **Arbitrary Waveform Generation**

† Component qualification in accordance with JEDEC and industry standards to ensure reliable operation over an extended temperature range. This includes, but is not limited to, Highly Accelerated Stress Test (HAST) or biased 85/85, temperature cycle, autoclave or unbiased HAST, electromigration, bond intermetallic life, and mold compound life. Such qualification testing should not be viewed as justifying use of this component beyond specified performance and environmental limits.

### description

The TLV5614 is a quadruple 12-bit voltage output digital-to-analog converter (DAC) with a flexible four-wire serial interface. The four-wire serial interface allows glueless interface to TMS320™ DSP family, SPI™, QSPI™, and Microwire™ serial ports. The TLV5614 is programmed with a 16-bit serial word comprised of a DAC address, individual DAC control bits, and a 12-bit DAC value. The device has provision for two supplies – one digital supply for the serial interface (via pins DV<sub>DD</sub> and DGND), and one for the DACs, reference buffers, and output buffers (via pins AV<sub>DD</sub> and AGND). Each supply is independent of the other and can be any value between 2.7 V and 5.5 V. The dual supplies allow a typical application where the DAC is controlled via a microprocessor operating on a 3-V supply (also used on pins DV<sub>DD</sub> and DGND), with the DACs operating on a 5-V supply. The digital and analog supplies can be tied together.

## 2.7-V TO 5.5-V 12-BIT 3- $\mu$ s QUADRUPLE DIGITAL-TO-ANALOG CONVERTER WITH POWER DOWN

SGLS355 – JUNE 2006

---

### description (continued)

The resistor string output voltage is buffered by a 2 $\times$  gain rail-to-rail output buffer. The buffer features a Class AB output stage to improve stability and reduce settling time. A rail-to-rail output stage and a power-down mode makes it ideal for single-voltage, battery-based applications. The settling time of the DAC is programmable to allow the designer to optimize speed versus power dissipation. The settling time is chosen by the control bits within the 16-bit serial input string. A high-impedance buffer is integrated on the REFINAB and REFINCD terminals to reduce the need for a low source-impedance drive to the terminal. REFINAB and REFINCD allow DAC A and B to have a different reference voltage than DAC C and D.

The TLV5614 is implemented with a CMOS process and is available in a 16-terminal TSSOP package. The TLV5614M is characterized for operation from  $-55^{\circ}\text{C}$  to  $125^{\circ}\text{C}$ .

## 2.7-V TO 5.5-V 12-BIT 3- $\mu$ s QUADRUPLE DIGITAL-TO-ANALOG CONVERTER WITH POWER DOWN

SGLS355 – JUNE 2006

### absolute maximum ratings over operating free-air temperature range (unless otherwise noted)<sup>†</sup>

Supply voltage, (DV <sub>DD</sub> , AV <sub>DD</sub> to GND)	7 V
Supply voltage difference (AV <sub>DD</sub> to DV <sub>DD</sub> )	–2.8 V to 2.8 V
Digital input voltage range	–0.3 V to DV <sub>DD</sub> + 0.3 V
Reference input voltage range	–0.3 V to AV <sub>DD</sub> + 0.3 V
Operating free-air temperature range, T <sub>A</sub>	–55°C to 125°C
Storage temperature range, T <sub>stg</sub>	–65°C to 150°C
Lead temperature 1,6 mm (1/16 in) from case for 10 s	260°C

<sup>†</sup> Stresses beyond those listed under “absolute maximum ratings” may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under “recommended operating conditions” is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

### recommended operating conditions

		MIN	NOM	MAX	UNIT
Supply voltage, AV <sub>DD</sub> , DV <sub>DD</sub>	5-V supply	4.5	5	5.5	V
	3-V supply	2.7	3	3.3	
High-level digital input voltage, V <sub>IH</sub>	DV <sub>DD</sub> = 2.7 V	2			V
	DV <sub>DD</sub> = 5.5 V	2.4			
Low-level digital input voltage, V <sub>IL</sub>	DV <sub>DD</sub> = 2.7 V	0.6			V
	DV <sub>DD</sub> = 5.5 V	1			
Reference voltage, V <sub>ref</sub> to REFINAB, REFINCD terminal	5-V supply, See Note 1	0	2.048	V <sub>DD</sub> – 1.5	V
	3-V supply, See Note 1	0	1.024	V <sub>DD</sub> – 1.5	
Load resistance, R <sub>L</sub>		2	10		k $\Omega$
Load capacitance, C <sub>L</sub>				100	pF
Serial clock rate, SCLK				20	MHz
Operating free-air temperature		–55		125	°C/W
Package thermal resistance, junction to ambient, $\theta_{JA}$			108.4		°C/W

NOTE 1: Voltages greater than AV<sub>DD</sub>/2 cause output saturation for large DAC codes.

## 2.7-V TO 5.5-V 12-BIT 3- $\mu$ s QUADRUPLE DIGITAL-TO-ANALOG CONVERTER WITH POWER DOWN

SGLS355 – JUNE 2006

electrical characteristics over recommended operating free-air temperature range,  $V_{ref} = 2.048$  V,  $AV_{DD} = DV_{DD} = 5$  V and  $V_{ref} = 1.024$  V for  $AV_{DD} = DV_{DD} = 3$  V (unless otherwise noted)

### static DAC specifications

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
Resolution			12			bits
Integral nonlinearity (INL), end point adjusted		See Note 1		$\pm 1.5$	$\pm 4$	LSB
Differential nonlinearity (DNL)		See Note 2		$\pm 0.5$	$\pm 1$	LSB
EZS	Zero-scale error (offset error at zero scale)	See Note 3			$\pm 12$	mV
Zero-scale error temperature coefficient		See Note 4		10		ppm/ $^{\circ}$ C
E <sub>G</sub>	Gain error	See Note 5			$\pm 0.7$	% of FS voltage
Gain-error temperature coefficient		See Note 6		10		ppm/ $^{\circ}$ C
PSRR	Power-supply rejection ratio	Zero scale	See Note 7 and Note 8		-80	dB
		Full scale			-80	dB

- NOTES:
- The relative accuracy or integral nonlinearity (INL), sometimes referred to as linearity error, is the maximum deviation of the output from the line between zero and full scale excluding the effects of zero code and full-scale errors.
  - The differential nonlinearity (DNL), sometimes referred to as differential error, is the difference between the measured and ideal 1-LSB amplitude change of any two adjacent codes. Monotonic means the output voltage changes in the same direction (or remains constant) as a change in the digital input code.
  - Zero-scale error is the deviation from zero voltage output when the digital input code is zero.
  - Zero-scale-error temperature coefficient is given by:  $E_{ZS} TC = [E_{ZS}(T_{max}) - E_{ZS}(T_{min})] / V_{ref} \times 10^6 / (T_{max} - T_{min})$ .
  - Gain error is the deviation from the ideal output ( $2 V_{ref} - 1$  LSB) with an output load of 10 k $\Omega$ , excluding the effects of the zero error.
  - Gain temperature coefficient is given by:  $E_G TC = [E_G(T_{max}) - E_G(T_{min})] / V_{ref} \times 10^6 / (T_{max} - T_{min})$ .
  - Zero-scale-error rejection ratio (EZS-RR) is measured by varying the  $AV_{DD}$  from  $5 \pm 0.5$  V and  $3 \pm 0.3$  V dc, and measuring the proportion of this signal imposed on the zero-code output voltage.
  - Full-scale rejection ratio (EG-RR) is measured by varying the  $AV_{DD}$  from  $5 \pm 0.5$  V and  $3 \pm 0.3$  V dc and measuring the proportion of this signal imposed on the full-scale output voltage after subtracting the zero-scale change.

### individual DAC output specifications

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
V <sub>O</sub>	Voltage output range	R <sub>L</sub> = 10 k $\Omega$	0		$AV_{DD} - 0.4$	V
Output load regulation accuracy		R <sub>L</sub> = 2 k $\Omega$ vs 10 k $\Omega$		0.1	0.25	% of FS voltage

### reference inputs (REFINAB, REFINCD)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
V <sub>I</sub>	Input voltage range	See Note 1	0		$AV_{DD} - 1.5$	V
R <sub>I</sub>	Input resistance			10		M $\Omega$
C <sub>I</sub>	Input capacitance			5		pF
Reference feed through		REFIN = 1 V <sub>PP</sub> at 1 kHz + 1.024 Vdc (see Note 2)		-75		dB
Reference input bandwidth		REFIN = 0.2 V <sub>PP</sub> + 1.024-Vdc large signal	Slow	0.5		MHz
			Fast	1		

- NOTES:
- Reference input voltages greater than  $V_{DD}/2$  cause output saturation for large DAC codes.
  - Reference feedthrough is measured at the DAC output, with an input code = 000 hex and a  $V_{ref}$  (REFINAB or REFINCD) input = 1.024 Vdc + 1 V<sub>PP</sub> at 1 kHz.

## APPLICATION INFORMATION

### general function

The TLV5614 is a 12-bit single-supply DAC based on a resistor string architecture. The device consists of a serial interface, speed and power-down control logic, a reference input buffer, a resistor string, and a rail-to-rail output buffer.

The output voltage (full scale determined by external reference) is given by:

$$2 \text{ REF } \frac{\text{CODE}}{2^n} \text{ [V]}$$

where REF is the reference voltage and CODE is the digital input value within the range of  $0_{10}$  to  $2^n-1$ , where  $n = 12$  (bits). The 16-bit data word, consisting of control bits and the new DAC value, is illustrated in the *data format* section. A power-on reset initially resets the internal latches to a defined state (all bits zero).

### serial interface

Explanation of data transfer: First, the device has to be enabled with  $\overline{\text{CS}}$  set to low. Then, a falling edge of FS starts shifting the data bit per bit (starting with the MSB) to the internal register on the falling edges of SCLK. After 16 bits have been transferred or FS rises, the content of the shift register is moved to the DAC latch, which updates the voltage output to the new level.

The serial interface of the TLV5614 can be used in two basic modes:

- Four wire (with chip select)
- Three wire (without chip select)

Using chip select (four-wire mode), it is possible to have more than one device connected to the serial port of the data source (DSP or microcontroller). The interface is compatible with the TMS320 DSP family. Figure 16 shows an example with two TLV5614s connected directly to a TMS320 DSP.

Figure 16. TMS320™ Interface

**TLV5614-EP**  
**2.7-V TO 5.5-V 12-BIT 3- $\mu$ s QUADRUPLE DIGITAL-TO-ANALOG CONVERTER**  
**WITH POWER DOWN**

SGLS355 – JUNE 2006

**APPLICATION INFORMATION**

**serial interface (continued)**

If there is no need to have more than one device on the serial bus, then  $\overline{CS}$  can be tied low. Figure 17 shows an example of how to connect the TLV5614 to a TMS320, SPI, or Microwire port using only three pins.

**Figure 17. Three-Wire Interface**

Notes on SPI and Microwire: Before the controller starts the data transfer, the software has to generate a falling edge on the I/O pin connected to FS. If the word width is 8 bits (SPI and Microwire), two write operations must be performed to program the TLV5614. After the write operation(s), the DAC output is updated automatically on the next positive clock edge, following the sixteenth falling clock edge.

**serial clock frequency and update rate**

The maximum serial clock frequency is given by:

$$f_{SCLKmax} = \frac{1}{t_{wH(min)} + t_{wL(min)}} = 20 \text{ MHz}$$

The maximum update rate is:

$$f_{UPDATEmax} = \frac{1}{16(t_{wH(min)} + t_{wL(min)})} = 1.25 \text{ MHz}$$

Note that the maximum update rate is a theoretical value for the serial interface, since the settling time of the TLV5614 has to be considered also.

**data format**

The 16-bit data word for the TLV5614 consists of two parts:

- Control bits (D15 . . . D12)
- New DAC value (D11 . . . D0)

D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0
A1	A0	PWR	SPD	New DAC value (12 bits)											

X: Don't care

SPD: Speed control bit: 1 → fast mode 0 → slow mode

PWR: Power control bit: 1 → power down 0 → normal operation

## APPLICATION INFORMATION

### data format (continued)

In power-down mode, all amplifiers within the TLV5614 are disabled. A particular DAC (A, B, C, D) of the TLV5614 is selected by A1 and A0 within the input word.

A1	A0	DAC
0	0	A
0	1	B
1	0	C
1	1	D

### TLV5614 interfaced to TMS320C203 DSP

#### hardware interfacing

Figure 18 shows an example of how to connect the TLV5614 to a TMS320C203 DSP. The serial port is configured in burst mode, with FSX generated by the TMS320C203 to provide the frame synchronization (FS) input to the TLV5614. Data is transmitted on the DX line, with the serial clock input on the CLKX line. The general-purpose input/output port bits, IO0 and IO1, are used to generate the chip select ( $\overline{CS}$ ) and DAC latch update ( $\overline{LDAC}$ ) inputs to the TLV5614. The active-low power down ( $\overline{PD}$ ) is pulled high all the time to ensure the DACs are enabled.

**Figure 18. TLV5614 Interfaced With TMS320C203**

#### software

The application example outputs a differential in-phase (sine) signal between the VOUTA and VOUTB pins, and its quadrature (cosine) signal as the differential signal between VOUTC and VOUTD.

The on-chip timer is used to generate interrupts at a fixed frequency. The related interrupt service routine pulses  $\overline{LDAC}$  low to update all four DACs simultaneously, then fetches and writes the next sample to all four DACs. The samples are stored in a look-up table, which describes two full periods of a sine wave.

The synchronous serial port of the DSP is used in burst mode. In this mode, the processor generates an FS pulse preceding the MSB of every data word. If multiple, contiguous words are transmitted, a violation of the  $t_{su}(C16-FS)$  timing requirement occurs. To avoid this, the program waits until the transmission of the previous word has been completed.

## 2.7-V TO 5.5-V 12-BIT 3- $\mu$ s QUADRUPLE DIGITAL-TO-ANALOG CONVERTER WITH POWER DOWN

SGLS355 - JUNE 2006

### APPLICATION INFORMATION

```
-----
; Processor:  TMS320C203 running at 40 MHz
;
; Description:
;
; This program generates a differential in-phase (sine) on (OUTA-OUTB) and it's
; quadrature (cosine) as a differential signal on (OUTC-OUTD).
;
; The DAC codes for the signal samples are stored as a table of 64 12-bit values,
; describing 2 periods of a sine function. A rolling pointer is used to address the
; table location in the first period of this waveform, from which the DAC A samples
; are read. The samples for the other 3 DACs are read at an offset to this rolling
; pointer:
;   DAC      Function      Offset from rolling pointer
;   A        sine          0
;   B        inverse sine  16
;   C        cosine        8
;   D        inverse cosine24
;
; The on-chip timer is used to generate interrupts at a fixed rate. The interrupt
; service routine first pulses LDAC low to update all DACs simultaneously
; with the values which were written to them in the previous interrupt. Then all
; 4 DAC values are fetched and written out through the synchronous serial interface
; Finally, the rolling pointer is incremented to address the next sample, ready for
; the next interrupt.

## APPLICATION INFORMATION

### TLV5614 interfaced to MCS<sup>®</sup>51 microcontroller

#### hardware interfacing

Figure 19 shows an example of how to connect the TLV5614 to an MCS<sup>®</sup>51 Microcontroller. The serial DAC input data and external control signals are sent via I/O port 3 of the controller. The serial data is sent on the RxD line, with the serial clock output on the TxD line. Port 3 bits 3, 4, and 5 are configured as outputs to provide the DAC latch update ( $\overline{\text{LDAC}}$ ), chip select ( $\overline{\text{CS}}$ ) and frame sync (FS) signals for the TLV5614. The active low power down pin ( $\overline{\text{PD}}$ ) of the TLV5614 is pulled high to ensure that the DACs are enabled.

**Figure 19. TLV5614 Interfaced With MCS<sup>®</sup>51**

#### software

The example is the same as for the TMS320C203 in this data sheet, but adapted for a MCS<sup>®</sup>51 controller. It generates a differential in-phase (sine) signal between the VOUTA and VOUTB pins, and its quadrature (cosine) signal is the differential signal between VOUTC and VOUTD.

The on-chip timer is used to generate interrupts at a fixed frequency. The related interrupt service routine pulses  $\overline{\text{LDAC}}$  low to update all four DACs simultaneously, then fetches and writes the next sample to all four DACs. The samples are stored as a look-up table, which describes one full period of a sine wave.

The serial port of the controller is used in Mode 0, which transmits 8 bits of data on RxD, accompanied by a synchronous clock on TxD. Two writes, concatenated together, are required to write a complete word to the TLV5614. The  $\overline{\text{CS}}$  and FS signals are provided in the required fashion through control of IO port 3, which has bit addressable outputs.

**PACKAGING INFORMATION**

Orderable Device	Status <sup>(1)</sup>	Package Type	Package Drawing	Pins	Package Qty	Eco Plan <sup>(2)</sup>	Lead/Ball Finish	MSL Peak Temp <sup>(3)</sup>
TLV5614MPWREP	ACTIVE	TSSOP	PW	16	2000	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-1-260C-UNLIM
V62/06602-01XE	ACTIVE	TSSOP	PW	16	2000	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-1-260C-UNLIM

<sup>(1)</sup> The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBsolete:** TI has discontinued the production of the device.

<sup>(2)</sup> Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

**TBD:** The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

**Green (RoHS & no Sb/Br):** TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

<sup>(3)</sup> MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

**Important Information and Disclaimer:**The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties.  C. Body dimensions do not include mold flash or protrusion not to exceed 0,15.  
 D. Falls within JEDEC MO-153

## IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
