### GENERAL DESCRIPTION

The HDS/HDH series of digital to analog converters represent the fastest precision settling current and voltage DAC's available. Capable of processing to MIL-STD-883 and guaranteed monotonicity over their operating temperature range; their quiescent power is 1/2 that of competitive units. The current output models provide 10mA full scale allowing direct drive of capacitive loads and transmission lines. All versions have a precision reference and are active laser trimmed to specified accuracy, thus no external adjustment pots or other components are required.

With 6 available units engineering trade-offs can be made between resolution, speed, current or voltage output, and of course price. To facilitate this comparison major specifications are summarized in Table 1.

Other general specifications that apply to all devices include TTL logic; glass or hermetic metal package; unipolar or bipolar operation with internal offsetting reference.

The HDH voltage output devices provide access to the op amp summing point so that reduced full scale output voltage swing can be provided. Such operation with an external resistor shunting the internal 1k resistor will reduce the already low op amp offset drift.

**NOTES:**

<sup>1</sup> Other voltages may be obtained with external resistor.  
<sup>2</sup> For HDS series,  $V_{OUT} = I_{OUT} \times R_{equivalent}$  which is the value of the 200Ω internal impedance in parallel with the external load resistance. Thus, by correct selection of external R<sub>L</sub>  $V_{OUT}$  can be any magnitude up to the + or - compliance voltage. See Figures 1 and 2.
