

SoundPLUS™ Stereo Audio DIGITAL-TO-ANALOG CONVERTER With Programmable PLL

FEATURES

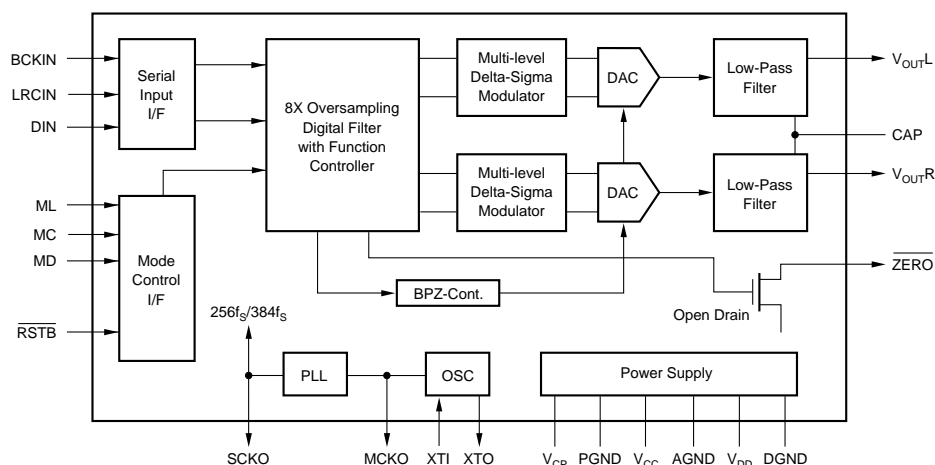

- ACCEPTS 16-, 20-, OR 24-BIT INPUT DATA
- COMPLETE STEREO DAC: Includes Digital Filter and Output Amp
- DYNAMIC RANGE: 94dB
- MULTIPLE SAMPLING FREQUENCIES:
16kHz, 22.05kHz, 24kHz
32kHz, 44.1kHz, 48kHz
64kHz, 88.2kHz, 96kHz
- PROGRAMMABLE PLL CIRCUIT:
256f_s/384f_s from 27MHz Master Clock
- NORMAL OR I²S™ DATA INPUT FORMATS
- SELECTABLE FUNCTIONS:
Soft Mute
Digital Attenuator (256 Steps)
Digital De-emphasis
- OUTPUT MODE: Left, Right, Mono, Mute

DESCRIPTION

The PCM1723 is a complete, low-cost, stereo audio digital-to-analog converter (DAC) with a phase-locked loop (PLL) circuit included. The PLL derives either a 256f_s or 384f_s system clock from an external 27MHz reference frequency. The DAC contains a 3rd-order delta-sigma (ΔΣ) modulator, a digital interpolation filter, and an analog output amplifier. The PCM1723 can accept 16-, 20-, or 24-bit input data in either normal or I²S formats.

The digital filter performs an 8X interpolation function and includes selectable features such as soft mute, digital attenuation and digital de-emphasis. The PLL can be programmed for sampling at standard digital audio frequencies as well as one-half and double sampling frequencies.

The PCM1723 is ideal for applications which combine compressed audio and video data such as DVD, DVD-ROM, set-top boxes and MPEG sound cards.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

SoundPLUS is a trademark of Texas Instruments.
I²S is a trademark of NXP Semiconductors.
All other trademarks are the property of their respective owners.

PRODUCTION DATA information is current as of publication date. Products conform to specifications per the terms of Texas Instruments standard warranty. Production processing does not necessarily include testing of all parameters.

ELECTROSTATIC DISCHARGE SENSITIVITY

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

ABSOLUTE MAXIMUM RATINGS⁽¹⁾

Power Supply Voltage	+6.5V
+V _{CC} to +V _{DD} Difference	±0.1V
Input Logic Voltage	-0.3V to (V _{DD} + 0.3V)
Input Current (except power supply)	±10mA
Power Dissipation	530mW
Operating Temperature Range	-25°C to +85°C
Storage Temperature	-55°C to +125°C
Lead Temperature (soldering, 5s)	+260°C
Thermal Resistance, θ_{JA}	+70°C/W

NOTE: (1) Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. Exposure to absolute maximum conditions for extended periods may affect device reliability.

PACKAGE INFORMATION⁽¹⁾

PRODUCT	PACKAGE	PACKAGE DESIGNATOR

NOTE: (1) For the most current package and ordering information, see the Package Option Addendum at the end of this data sheet, or see the TI web site at www.ti.com

PIN CONFIGURATION

PIN ASSIGNMENTS

PIN	NAME	TYPE	FUNCTION
1	XTI	IN	Master Clock Input.
2	SCKO	OUT	System Clock Out. This output is 256f _S or 384f _S system clock generated by the internal PLL.
3	V _{CP}	PWR	PLL Power Supply (+5V).
4	NC	N/A	No connection.
5	MCKO	Out	Buffered clock output of crystal oscillator.
6 ⁽¹⁾	ML	IN	Latch for serial control data.
7 ⁽¹⁾	MC	IN	Clock for serial control data.
8 ⁽¹⁾	MD	IN	Data for serial control.
9 ⁽¹⁾	RSTB	IN	Reset Input. When this pin is low, the digital filters and modulators are held in reset.
10	ZERO	OUT	Zero Data Flag. This pin is low when the input data is continuously zero for more than 65, 535 cycles of BCKIN.
11	V _{OUTR}	OUT	Right Channel Analog Output.
12	AGND	GND	Analog Ground.
13	V _{CC}	PWR	Analog Power Supply (+5V).
14	V _{OUTL}	OUT	Left Channel Analog Output.
15	CAP		Common pin for analog output amplifiers.
16 ⁽²⁾	BCKIN	IN	Bit clock for clocking in the audio data.
17 ⁽²⁾	DIN	IN	Serial audio data input.
18 ⁽²⁾	LRCIN	IN	Left/Right Word Clock. Frequency is equal to f _S .
19	NC	N/A	No connection.
20	RES	N/A	Reserved for factory use, do not connect.
21	V _{DD}	PWR	Analog Power Supply (+5V).
22	DGND	GND	Digital Ground.
23	PGND	GND	PLL Ground.
24	XTO	Out	Crystal oscillator output.

NOTES: (1) Schmitt trigger input with internal pull-up resistors.
(2) Schmitt trigger input.

TYPICAL CHARACTERISTICS

At $T_A = +25^\circ\text{C}$, $V_{CC} = V_{DD} = V_{CP} = +5\text{V}$, $f_S = 44.1\text{kHz}$, 16-bit input data, $384f_S$, unless otherwise noted. Measurement bandwidth is 20kHz.

DYNAMIC PERFORMANCE

TYPICAL CHARACTERISTICS (Cont.)

At $T_A = +25^\circ\text{C}$, $V_S = +5\text{V}$, $R_L = 44.1\text{kHz}$, and $f_{\text{SYS}} = 384f_s$, unless otherwise noted.

DIGITAL FILTER

TYPICAL CONNECTION DIAGRAM

Figure 1 illustrates the typical connection diagram for the PCM1723 in an MPEG-2 application. The 27MHz master video clock (f_M) drives XTI (pin 1) of the PCM1723. A programmable system clock is generated by the PCM1723 PLL, with SCKO used to drive the MPEG-2 decoder system clock input. The standard audio signals (data, bit clock, and word clock) are generated in the decoder from the PCM1723 system clock, providing synchronization of audio and video signals.

PLL CIRCUIT

The PCM1723 has a programmable internal PLL circuit, as shown in Figure 2. The PLL is designed to accept a 27MHz master clock or crystal oscillator and generate all internal system clocks required to operate the digital filter and $\Delta\Sigma$ modulator, either at $256f_S$ or $384f_S$. If an external master clock is used, XTO must be connected to GND. In both cases, the signal amplitude on XTI must satisfy the specification described in Figure 3. Therefore, careful C1 and C2 determination is required to keep this specification satisfied when

FIGURE 6. I²S Data Input Timing.

FIGURE 7. Audio Data Input Timing.

using a crystal oscillator. The PLL will directly track any variations in the master clock frequency, and jitter on the system clock is specified at 250ps maximum. Figure 3 illustrates the timing requirements for the 27MHz master clock. Figure 4 illustrates the system clock connections for an external clock or crystal oscillator.

The PCM1723 internal PLL can be programmed for nine different sampling frequencies (LRCIN), as shown in Table I. The internal sampling clocks generated by the various programmed frequencies are shown in Table II. The system clock output frequency for the PCM1723 is 100% accurate. To provide MCKO clock and SCKO clock for external circuit, external buffer circuit is effective to avoid degrading audio performance.

	Sampling Frequencies-LRCIN (kHz)

SPECIAL FUNCTIONS

The PCM1723 includes several special functions, including digital attenuation, digital de-emphasis, soft mute, data format selection and input word resolution. These functions are controlled using a three-wire interface. MD (pin 8) is used for the program data, MC (pin 7) is used to clock in the program data, and ML (pin 6) is used to latch in the program data. Table III lists the selectable special functions.

FUNCTION	DEFAULT MODE
Input Audio Data Format Selection Normal Format I ² S Format	Normal Format
Input Audio Data Bit Selection 16/20/24 Bits	16 Bits

PROGRAM REGISTER BIT MAPPING

The PCM1723 special functions are controlled using four program registers that are 16 bits long. These registers are all loaded using MD. After the 16 data bits are clocked in, ML is used to latch in the data to the appropriate register. Table IV shows the complete mapping of the four registers and Figure 8 illustrates the serial interface timing.

REGISTER NAME	BIT NAME	DESCRIPTION
Register 0	AL (7:0)	DAC Attenuation Data for Lch
	LDL	Attenuation Data Load Control for Lch
	A (1:0)	Register Address
	Res	Reserved
Register 1	AR (7:0)	DAC Attenuation Data for Rch

TABLE IV. Internal Register Mapping.

REGISTER 0 (A1 = 0, A0 = 0)

B15	B14	B13	B12	B11	B10	B9	B8	B7	B6	B5	B4	B3	B2	B1	B0
res	res	res	res	res	A1	A0	LDL	AL7	AL6	AL5	AL4	AL3	AL2	AL1	AL0

Register 0 is used to control left channel attenuation. Bits 0 - 7 (AL0 - AL7) are used to determine the attenuation level. The level of attenuation is given by:

$$ATT = [20 \log_{10} (ATT_DATA/255)] \text{ dB}$$

ATTENUATION DATA LOAD CONTROL

Bit 8 (LDL) is used to control the loading of attenuation data in B0:B7. When LDL is set to 0, attenuation data will be loaded into AL0:AL7, but it will not affect the attenuation

level until LDL is set to 1. LDR in Register 1 has the same function for right channel attenuation.

Attenuation Level (ATT) can be controlled as following Resistor set AL (R) (7:0).

AL (R) (7:0)	ATT LEVEL
00h	-∞dB (Mute)
01h	-48.16dB
.	.
.	.
.	.
FEh	-0.07dB
FFh	0dB

REGISTER 1 (A1 = 0, A0 = 1)

B15	B14	B13	B12	B11	B10	B9	B8	B7	B6	B5	B4	B3	B2	B1	B0
res	res	res	res	res	A1	A0	LDR	AR7	AR6	AR5	AR4	AR3	AR2	AR1	AR0

Register 1 is used to control right channel attenuation. As in Register 1, bits 0 - 7 (AR0 - AR7) control the level of attenuation.

REGISTER 2 (A1 = 1, A0 = 0)

B15	B14	B13	B12	B11	B10	B9	B8	B7	B6	B5	B4	B3	B2	B1	B0
res	res	res	res	res	A1	A0	PL3	PL2	PL1	PL0	IW1	IW0	OPE	DEM	MUTE

Register 2 is used to control soft mute, de-emphasis, operation enable, input resolution, and output format. Bit 0 is used for soft mute: a HIGH level on bit 0 will cause the output to be muted (this is ramped down in the digital domain, so no *click* is audible). Bit 1 is used to control de-emphasis. A LOW level on bit 1 disables de-emphasis, while a HIGH level enables de-emphasis.

Bit 2 (OPE) is used for operational control. Table V illustrates the features controlled by OPE.

	DATA INPUT	DAC OUTPUT	SOFTWARE MODE INPUT
OPE = 1	Zero	Forced to BPZ ⁽¹⁾	Enabled
	Other	Forced to BPZ ⁽¹⁾	Enabled
OPE = 0	Zero	Controlled by IZD	Enabled
	Other	Normal	Enabled

NOTE: (1) ΔΣ is disconnected from output amplifier.

TABLE V. Operation Enable (OPE) Function.

OPE controls the operation of the DAC: when OPE is LOW, the DAC will convert all non-zero input data. If the input data is continuously zero for 65,536 cycles of BCKIN, the output will be forced to zero only if IZD is HIGH. When OPE is HIGH, the output of the DAC will be forced to bipolar zero, irrespective of any input data.

	DATA INPUT	DAC OUTPUT
IZD = 1	Zero	Forced to BPZ ⁽¹⁾
	Other	Normal
IZD = 0	Zero	Zero ⁽²⁾
	Other	Normal

NOTES: (1) $\Delta\Sigma$ is disconnected from output amplifier.
(2) $\Delta\Sigma$ is connected to output amplifier.

TABLE VI. Infinite Zero Detection (IZD) Function.

	DATA INPUT	DAC OUTPUT	SOFTWARE MODE INPUT
RSTB = HIGH	Zero	Controlled by OPE and IZD	Enabled
	Other	Controlled by OPE and IZD	Enabled
RSTB = LOW	Zero	Forced to BPZ ⁽¹⁾	Disabled
	Other	Forced to BPZ ⁽¹⁾	Disabled

NOTE: (1) $\Delta\Sigma$ is disconnected from output amplifier.

TABLE VII. Reset (RSTB) Function.

Bits 3 (IW0) and 4 (IW1) are used to determine input word resolution. PCM1723 can be set up for input word resolutions of 16, 20, or 24 bits:

Bit 4 (IW1)	Bit 3 (IW0)	Input Resolution
0	0	16-bit Data Word
0	1	20-bit Data Word
1	0	24-bit Data Word
1	1	Reserved

Bits 5, 6, 7, and 8 (PL0:3) are used to control output format. The output of PCM1723 can be programmed for 16 different states, as shown in Table VIII.

PL0	PL1	PL2	PL3	Lch OUTPUT	Rch OUTPUT	NOTE
0	0	0	0	MUTE	MUTE	MUTE
0	0	0	1	MUTE	R	
0	0	1	0	MUTE	L	
0	0	1	1	MUTE	(L + R)/2	
0	1	0	0	R	MUTE	
0	1	0	1	R	R	
0	1	1	0	R	L	REVERSE
0	1	1	1	R	(L + R)/2	
1	0	0	0	L	MUTE	
1	0	0	1	L	R	STEREO
1	0	1	0	L	L	
1	0	1	1	L	(L + R)/2	
1	1	0	0	(L + R)/2	MUTE	
1	1	0	1	(L + R)/2	R	
1	1	1	0	(L + R)/2	L	
1	1	1	1	(L + R)/2	(L + R)/2	MONO

TABLE VIII. Programmable Output Format.

REGISTER 3 (A1 = 1, A0 = 1)

B15	B14	B13	B12	B11	B10	B9	B8	B7	B6	B5	B4	B3	B2	B1	B0
res	res	res	res	res	A1	A0	IZD	SF1	SF0	DSR1	DSR0	SYS	ATC	LRP	I ² S

Register 3 is used to control input data format and polarity, attenuation channel control, system clock frequency, sampling frequency, and infinite zero detection.

Bits 0 (I²S) and 1 (LRP) are used to control the input data format. A LOW on bit 0 sets the format to Normal (MSB-first, right-justified Japanese format), and a HIGH sets the format to I²S (Philips serial data protocol). Bit 1 (LRP) is used to select the polarity of LRCIN (sample rate clock). When bit 1 is LOW, left channel data are assumed when LRCIN is in a HIGH phase and right channel data are assumed when LRCIN is in a LOW phase. When bit 1 is HIGH, the polarity assumption is reversed.

Bit 2 (ATC) is used for controlling the attenuator. When bit 2 is HIGH, the attenuation data loaded in program Register 0 are used for both left and right channels. When bit 2 is LOW, the attenuation data for each register are applied separately to left and right channels.

Bit 3 (SYS) is the system clock selection. When bit 3 is LOW, the system clock frequency is set to 384f_s. When bit 3 is HIGH, the system clock frequency is set to 256f_s.

Bits 4 (DSR0) and 5 (DSR1) are used to control multiples of the sampling rate:

DSR1	DSR0	Multiple	
0	0	Normal	32/44.1/48kHz
0	1	Double	64/88.2/96kHz
1	0	One-half	16/22.05/24kHz
1	1	Reserved	Not Defined

Bits 6 (SF0) and 7 (SF1) are used to select the sampling frequency. Frequency selection must be made with an interval time greater than 20μs.

SF1	SF0	Sampling Frequency	
0	0	44.1kHz group	22.05/44.1/88.2kHz
0	1	48kHz group	24/48/96kHz
1	0	32kHz group	16/32/64kHz
1	1	Reserved	Not Defined

Bit 8 is used to control the infinite zero detection function (IZD).

When IZD is LOW, the zero detect circuit is off. Under this condition, no automatic muting will occur if the input is continuously zero. When IZD is HIGH, the zero detect feature is enabled. If the input data are continuously zero for 65,536 cycles of BCKIN, the output will be immediately forced to a bipolar zero state ($V_{CC}/2$). The zero detection feature is used to avoid noise which may occur when the input is DC. When the output is forced to bipolar zero, there may be an audible click. PCM1723 allows the zero detect feature to be disabled so the user can implement an external muting circuit.

FIGURE 8. Three-Wire Serial Interface.

FIGURE 9. Program Register Input Timing.

APPLICATION CONSIDERATIONS

DELAY TIME

There is a finite delay time in delta-sigma converters. In analog-to-digital converters (ADCs), this is commonly referred to as latency. For a delta-sigma DAC, delay time is determined by the order number of the FIR filter stage, and the chosen sampling rate. The following equation expresses the delay time of PCM1723:

$$t_D = 11.125 \times 1/f_s$$

$$\text{For } f_s = 44.1\text{kHz, } t_D = 11.125/44.1\text{kHz} = 251.4\mu\text{s}$$

Applications using data from a disc or tape source, such as CD audio, CD-Interactive, Video CD, DAT, Minidisc, etc., generally are not affected by delay time. For some profes-

sional applications such as broadcast audio for studios, it is important for total delay time to be less than 2ms.

OUTPUT FILTERING

For testing purposes all dynamic tests are done on the PCM1723 using a 20kHz low-pass filter. This filter limits the measured bandwidth for THD+N, etc. to 20kHz. Failure to use such a filter will result in higher THD+N and lower SNR and Dynamic Range readings than are found in the specifications. The low-pass filter removes out of band noise. Although it is not audible, it may affect dynamic specification numbers.

The performance of the internal low-pass filter from DC to 24kHz is shown in Figure 10. The higher frequency rolloff of the filter is shown in Figure 11. If an application has the PCM1723 driving a wideband amplifier, it is recommended to use an external low-pass filter. A simple 3rd-order filter is shown in Figure 12. For some applications, a passive RC filter or 2nd-order filter may be adequate.

Reset

The PCM1723 has both internal power-on reset circuit and the $\overline{\text{RSTB}}$ pin (pin 9) that accepts an external forced reset by

$\overline{\text{RSTB}} = \text{LOW}$. For internal power on reset, initialize (reset) is done automatically at power on $V_{\text{DD}} > 2.2\text{V}$ (typ). During internal reset = LOW, the output of the DAC is invalid and the analog outputs are forced to $V_{\text{CC}}/2$. Figure 13 illustrates the timing of internal power on reset.

The PCM1723 accepts an external forced reset when $\overline{\text{RSTB}} = \text{L}$. During $\overline{\text{RSTB}} = \text{L}$, the output of the DAC is invalid and the analog outputs are forced to $V_{\text{CC}}/2$ after internal initialize (1024 system clocks count after $\overline{\text{RSTB}} = \text{H}$). Figure 14 illustrates the timing of $\overline{\text{RSTB}}$ pin reset.

FIGURE 10. Low-Pass Filter Frequency Response.

FIGURE 11. Low-Pass Filter Wideband Frequency Response.

FIGURE 12. 3rd-Order Low-Pass Filter.

FIGURE 13. Internal Power-On Reset Timing.

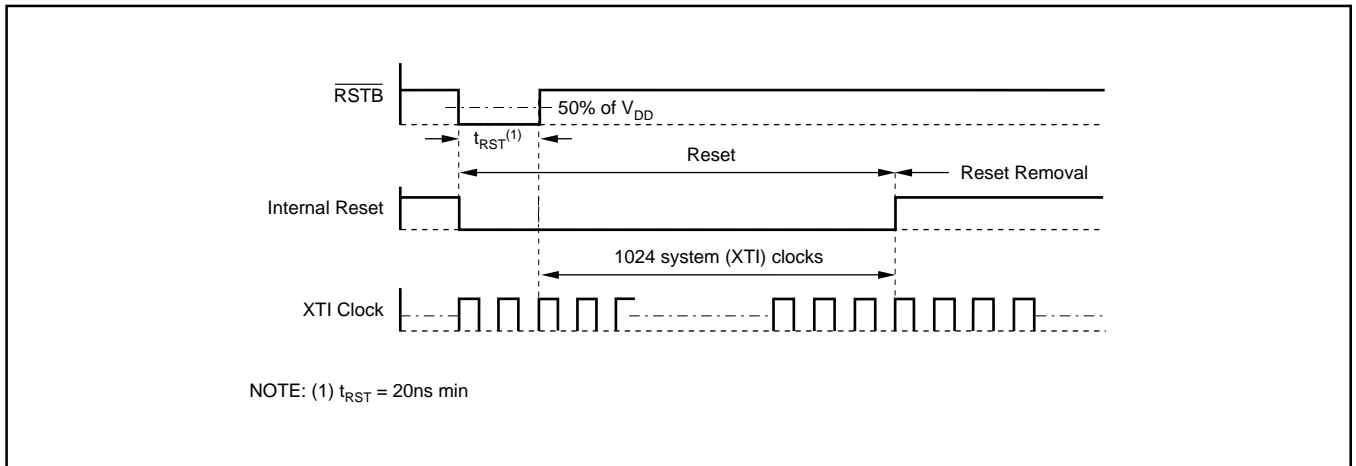

FIGURE 14. RSTB-Pin Reset Timing.

POWER SUPPLY CONNECTIONS

The PCM1723 has three power supply connections: digital (V_{DD}), analog (V_{CC}), and PLL (V_{CP}). Each connection also has a separate ground return pin. It is acceptable to use a common +5V power supply for all three power pins. If separate supplies are used without a common connection, the delta between the supplies during ramp-up time must be less than 0.6V. An application circuit to avoid a power-on latch-up condition is shown in Figure 15.

BYPASSING POWER SUPPLIES

The power supplies should be bypassed as close as possible to the unit. Refer to Figure 18 for optimal values of bypass capacitors. It is also recommended to include a 0.1 μF ceramic capacitor in parallel with the 10 μF tantalum capacitor.

FIGURE 15. Latch-up Prevention Circuit.

THEORY OF OPERATION

The delta-sigma section of the PCM1723 is based on a 5-level amplitude quantizer and a 3rd-order noise shaper. This section converts the oversampled input data to 5-level delta-sigma format.

A block diagram of the 5-level delta-sigma modulator is shown in Figure 16. This 5-level delta-sigma modulator has the advantage of stability and clock jitter sensitivity over the typical one-bit (2 level) delta-sigma modulator.

The combined oversampling rate of the delta-sigma modulator and the internal 8X interpolation filter is $48f_s$ for a $384f_s$ system clock, and $64f_s$ for a $256f_s$ system clock. The theoretical quantization noise performance of the 5-level delta-sigma modulator is shown in Figure 17.

AC-3 APPLICATION CIRCUIT

A typical application for the PCM1723 is AC-3 5.1 channel audio decoding and playback. This circuit uses the PCM1723 to develop the audio system clock from the 27MHz video clock, with the SCKO pin used to drive the AC-3 decoder and two PCM1720 units, the non-PLL version of the PCM1723.

Revision History

DATE	REVISION	PAGE	SECTION	DESCRIPTION
5/07	A	—	Entire Document	Updated format and added missing overbars to RSTB and ZERO pins.
		2	Electrical Characteristics	Added "Selectable" to <i>Audio Data Interface Format</i> typical value column.
				Deleted "Selectable" from <i>Audio Data Format</i> unit column.
		6	PLL Circuit	Changed "XTO should be connected" to "XTO must be connected."
				Added sentence regarding XTI signal amplitude and C1, C2 determination.
			Figure 3	Changed 2.0V/0.8V to 1.2V/0.4V.
		8	PLL Circuit	Deleted paragraph regarding frequency error.
10	Register 3	Added sentence to Bit 6 regarding interval time must be greater than 20 μ s.		

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

⁽¹⁾ The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

⁽²⁾ Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

⁽³⁾ MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

Important Information and Disclaimer:The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

Carrier tape design is defined largely by the component length, width, and thickness.

A_o = Dimension designed to accommodate the component width.
B_o = Dimension designed to accommodate the component length.
K_o = Dimension designed to accommodate the component thickness.
W = Overall width of the carrier tape.
P = Pitch between successive cavity centers.

TAPE AND REEL INFORMATION

Device	Package	Pins	Site	Reel Diameter (mm)	Reel Width (mm)	A0 (mm)	B0 (mm)	K0 (mm)	P1 (mm)	W (mm)	Pin1 Quadrant

PLASTIC SMALL-OUTLINE

28 PINS SHOWN

- NOTES: A. All linear dimensions are in millimeters.
 B. This drawing is subject to change without notice.
 C. Body dimensions do not include mold flash or protrusion not to exceed 0,15.
 D. Falls within JEDEC MO-150

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
