# 4.5-/3.5-Digit Panel Meters with 4-20mA Output 

#### Abstract

General Description The MAX1366/MAX1368 low-power, 4.5- and 3.5-digit, panel meters feature an integrated sigma-delta analog-to-digital converter (ADC), LED display drivers, voltage digital-to-analog converter (DAC), and a 4-20mA (or 0 to 16 mA ) current driver. The MAX1366/MAX1368's analog input voltage range is programmable to either $\pm 2 \mathrm{~V}$ or $\pm 200 \mathrm{mV}$. The MAX1368 drives a 3.5 -digit ( $\pm 1999$ count) display and the MAX1366 drives a 4.5 -digit ( $\pm 19,999$ count) display. The ADC output directly drives the LED display as well as the voltage DAC, which, in turn, drives the $4-20 \mathrm{~mA}$ (or 0 to 16 mA ) current-loop output. In normal operation, the 0 to $16 \mathrm{~mA} / 4-20 \mathrm{~mA}$ currentloop output follows the $\pm 2 \mathrm{~V}$ or $\pm 200 \mathrm{mV}$ analog input to drive remote panel-meter displays, data loggers, and other industrial controllers. For added flexibility, the MAX1366/MAX1368 allow direct access to the ADC result, DAC output, and the V/I converter input. The sigma-delta ADC does not require external precision integrating capacitors, autozero capacitors, crystal oscillators, charge pumps, or other circuitry commonly required in dual-slope ADC panel-meter circuits. Onchip analog input and reference buffers allow direct interface with high-impedance signal sources. Excellent common-mode rejection and digital filtering provides greater than 100 dB rejection of simultaneous 50 Hz and 60 Hz line noise. Other features include data hold and peak detection and overrange/underrange detection. The MAX1366/MAX1368 require a 2.7 V to 5.25 V supply, a 4.75 V to 5.25 V V/I supply, and a 7 V to 30 V loop supply. They are available in a space-saving ( $7 \mathrm{~mm} x$ 7 mm ), 48-pin TQFP package and operate over the extended $\left(-40^{\circ} \mathrm{C}\right.$ to $\left.+85^{\circ} \mathrm{C}\right)$ temperature range.

## Applications

Industrial Process Control
Automated Test Equipment
Data-Acquisition Systems
Digital Panel Meters
Digital Voltmeters
Digital Multimeters

Pin Configuration appears at end of data sheet.
Typical Operating Circuits appear at end of data sheet.
SPI/QSPI are trademarks of Motorola, Inc.
MICROWIRE is a trademark of National Semiconductor Corp.

Features

- Microcontroller ( $\mu$ C)-Interface, Digital Panel Meter 20-Bit Sigma-Delta ADC
4.5-Digit Resolution ( $\pm 19,999$ Count, MAX1366)
3.5-Digit Resolution ( $\pm 1999$ Count, MAX1368)

No Integrating/Autozeroing Capacitors
$100 \mathrm{M} \Omega$ Input Impedance
$\pm 200 \mathrm{mV}$ or $\pm 2.000 \mathrm{~V}$ Input Range

- LED Display

Common-Cathode 7-Segment LED Driver
Programmable LED Current ( 0 to 20 mA )
2.5Hz Update Rate

- Output DAC and Current Driver
$\pm 15$-Bit DAC with 14 -Bit Linear V/I Converter
Selectable 0 to 16 mA or $\mathbf{4 - 2 0 m A}$ Current Output Unipolar/Bipolar Modes
$\pm 50 \mu \mathrm{~A}$ Zero Scale, $\pm 40 \mathrm{ppmFS} /{ }^{\circ} \mathrm{C}$ (typ)
$\pm 0.5 \%$ Gain Error, $\pm 25 \mathrm{ppmFS} /{ }^{\circ} \mathrm{C}$ (typ)
Separate 7V to 30V Supply for Current-Loop Output
- 2.7V to 5.25V ADC/DAC Supply
-4.75V to 5.25 V V/I Converter Supply
- Internal 2.048V Reference or External Reference
- SPI ${ }^{\text {TM }}$-/QSPI ${ }^{\text {TM }}$-/MICROWIRE ${ }^{\text {TM }}$-Compatible Serial Interface
- 48-Pin, 7mm x 7mm TQFP Package

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## ELECTRICAL CHARACTERISTICS

## ELECTRICAL CHARACTERISTICS (continued)

$\left(A V_{D D}=D V_{D D}=D A C \_V D D=+2.7 \mathrm{~V}\right.$ to $+5.25 \mathrm{~V}, \mathrm{GND}=0, \operatorname{LEDG}=0, \mathrm{~V}_{\text {LEDV }}=+2.7 \mathrm{~V}$ to $+5.25 \mathrm{~V}, \mathrm{~V}_{\mathrm{REF}}+-\mathrm{V}_{\mathrm{REF}}-2.048 \mathrm{~V}$ (external reference), $\mathrm{V}_{\text {EXT }}=7 \mathrm{~V}, \mathrm{~V}_{\text {REG_AMP }}=+5.0 \mathrm{~V}$, $\mathrm{CREF}_{+}=0.1 \mu \mathrm{~F}, \mathrm{REF}-=\mathrm{GND}, \mathrm{C}_{\text {NEGV }}=0.1 \mu \mathrm{~F}$. Internal clock mode, unless otherwise noted. All specifications are at $\mathrm{T}_{\mathrm{A}}=\mathrm{T}_{\text {MIN }}$ to $\mathrm{T}_{\text {MAX }}$. Typical values are at $\mathrm{T}_{\mathrm{A}}=+25^{\circ} \mathrm{C}$, unless otherwise noted.)

Note 1: Integral nonlinearity is the deviation of the analog value at any code from its theoretical value after nulling the gain error and offset error.
Note 2: Offset calibrated. See OFFSET_CAL1 AND OFFSET_CAL2 in the On-Chips Registers section.
Note 3: Offset nulled.
Note 4: Offset-drift error is eliminated by recalibration at the new temperature.
Note 5: The input voltage range for the analog inputs is given with respect to the voltage on the negative input of the differential pair.
Note 6: $\quad \mathrm{V}_{\text {AIN }}+$ or $\mathrm{V}_{\text {AIN }}=-2.2 \mathrm{~V}$ to +2.2 V . $\mathrm{V}_{\text {REF }}$ or $\mathrm{V}_{\text {REF }}=-2.2 \mathrm{~V}$ to +2.2 V . All input structures are identical. Production tested on AIN+ and REF+ only. VREF+ must always be greater than $V_{\text {REF }}$.
Note 7: Measured at DC by changing the power-supply voltage from 2.7 V to 5.25 V and measuring the effect on the conversion error with external reference. PSRR at 50 Hz and 60 Hz exceeds 120 dB with filter notches at 50 Hz and 60 Hz (Figure 1).
Note 8: CLK and SCLK are disabled.
Note 9: LED drivers are disabled.
Note 10: Power-supply currents are measured with all digital inputs at either GND or DVDD and with the device in internal clock mode.
Note 11: All input signals are specified with trise $=\mathrm{t}_{\text {FALL }}=5 \mathrm{~ns}\left(10 \%\right.$ to $90 \%$ of $\left.V_{D D}\right)$ and are timed from a voltage level of $50 \%$ of DVDD, unless otherwise noted.
Note 12: See the serial-interface timing diagrams (Figures 7-11).

## Typical Operating Characteristics

$\left(\right.$ AVDD $=$ DVDD $=+5 \mathrm{~V}, \mathrm{~V}_{\text {DAC_VDD }}=+5.0 \mathrm{~V}, \mathrm{GND}=0, \operatorname{LEDG}=0, \mathrm{~V}_{\text {LEDV }}=+2.7 \mathrm{~V}$ to $+5.25 \mathrm{~V}, \mathrm{~V}_{\text {REF }}+\mathrm{V}_{\text {REF }}=2.048 \mathrm{~V}$ (external reference), $V_{E X T}=7 \mathrm{~V}, \mathrm{C}_{\text {REF }+}=0.1 \mu \mathrm{~F}, \mathrm{REF}-=\mathrm{GND}, \mathrm{C}_{\mathrm{NEGV}}=0.1 \mu \mathrm{~F}$, RANGE bit $=1$, internal clock mode. $\mathrm{T}_{\mathrm{A}}=+25^{\circ} \mathrm{C}$, unless otherwise noted.)

## Microcontroller-Interface, 4.5-/3.5-Digit Panel Meters with 4-20mA Output

Pin Description

| PIN | NAME | FUNCTION |
| :---: | :---: | :---: |
| 1 | AIN+ | Positive Analog Input. Positive side of fully differential analog input. Bypass AIN+ to GND with a $0.1 \mu \mathrm{~F}$ or greater capacitor. |
| 2 | AIN- | Negative Analog Input. Negative side of fully differential analog input. Bypass AIN- to GND with a $0.1 \mu \mathrm{~F}$ or greater capacitor. |
| 3 | GND | Ground. Connect to star ground. |
| 4 | $A V_{D D}$ | Analog Positive Supply Voltage. Connect $A V_{D D}$ to $a+2.7 \mathrm{~V}$ to +5.25 V power supply. Bypass $A V_{D D}$ to GND with a $0.1 \mu \mathrm{~F}$ capacitor. |
| 5 | DV ${ }_{\text {DD }}$ | Digital Positive Supply Voltage. Connect DVDD to $\mathrm{a}+2.7 \mathrm{~V}$ to +5.25 V power supply. Bypass $\operatorname{DV}$ DD to GND with a $0.1 \mu \mathrm{~F}$ capacitor. |
| 6 | SET | Segment Current Set. Connect to ground through a resistor to set the segment current. See Table 7 for segment-current selection. |
| 7 | REG_VDD | V/I Converter Regulated Supply Output. REG_ VDD is typically 2.5V. |
| 8 | REG_FORCE | REG_VDD Control. Drives the gate of external depletion mode FET. |
| 9 | REG_AMP | Regulator/Reference Buffer Supply. Connect to a 4.75 V to 5.25 V power supply. |
| 10 | CMP | Regulator Compensation Node. Connect a $0.1 \mu \mathrm{~F}$ capacitor from CMP to REG_FORCE. |
| 11 | DAC_VDD | DAC Analog Supply. Connect DAC_VDD to a +2.7 V to +5.25 V power supply. |
| 12 | DACVOUT | DAC Voltage Output. DAC output impedance is typically $6.2 \mathrm{k} \Omega$. |
| 13 | CONV_IN | V/I Converter Input |
| 14 | 4-200UT | 4-20mA (0 to 16mA) Current-Loop Output. Referenced to GND. |
| 15 | GND_DAC | DAC Analog Ground. Connect to star ground. |
| 16 | GND_V/I | V/I Converter Analog Ground. Connect to star ground. |
| 17 | REF_DAC | V-to-I Converter/DAC Reference Input. Connect a voltage source for external reference operation or leave floating for internal reference. Bypass REF_DAC with a $0.1 \mu \mathrm{~F}$ capacitor to GND for either internal or external reference operation. |
| 18 | EN_BPM | Active-High V/I-Converter Bipolar-Mode Enable. Set high for bipolar mode. Set low for unipolar mode. |
| 19 | EN_I | Active-High V/I-Converter 4mA Offset Enable. Set low for 0 to 16mA output. Set high for 4-20mA |
| 20 | REFSELE | DAC External Reference Selection. Set low for internal reference. Set high for external reference. Leave REF_DAC unconnected when REFSELE is low. |
| 21 | DACDATA_SEL | DAC Data-Source Select. Set high to select DAC register. Set low to have the DAC follow the ADC output. |
| 22 | $\overline{\text { CS_DAC }}$ | DAC SPI Chip Select. See Table 8. |
| 23 | CLK | External Clock Input. When the EXTCLK register bit is set to one, CLK is the master clock input for the modulator, filter, and DAC. When the EXTCLK register bit is reset to zero, the internal clock is used. The default power-on state is EXTCLK $=0$ (internal clock mode). Connect CLK to GND or DV ${ }_{D D}$ when using internal clock. |
| 24 | EOC | Active-Low End-of-Conversion Logic Output. A logic-low at $\overline{\mathrm{EOC}}$ indicates that a new ADC result is available in the ADC result register. |

# Microcontroller-Interface, 4.5-/3.5-Digit Panel Meters with 4-20mA Output 

Pin Description (continued)

| PIN | NAME | FUNCTION |
| :---: | :---: | :---: |
| 25 | SCLK | Serial Clock Input. Apply an external clock to SCLK to facilitate communication through the serial bus. SCLK may idle high or low. |
| 26 | DOUT | Serial Data Output. DOUT presents serial data in response to register queries. Data shifts out on the falling edge of SCLK. DOUT goes high impedance when $\overline{\mathrm{CS}}$ is high. |
| 27 | DIN | Serial Data Input. Data present at DIN is shifted into the internal registers in response to a rising edge at SCLK when CS is low. |
| 28 | $\overline{\mathrm{CS}}$ | Active-Low Chip-Select Input. Forcing $\overline{\mathrm{CS}}$ low activates the serial interface. (See Table 8.) |
| 29 | LEDG | LED Segment-Drivers Ground |
| 30 | DIGO | Digit 0 Driver Out (Connected to GLED for the MAX1368) |
| 31 | DIG1 | Digit 1 Driver Out |
| 32 | DIG2 | Digit 2 Driver Out |
| 33 | DIG3 | Digit 3 Driver Out |
| 34 | DIG4 | Digit 4 Driver Out |
| 35 | SEGA | Segment A Driver |
| 36 | SEGB | Segment B Driver |
| 37 | LEDV | LED-Display Segment-Driver Supply. Connect to a +2.7 V to +5.25 V supply. Bypass with a $0.1 \mu \mathrm{~F}$ capacitor to LEDG. |
| 38 | SEGC | Segment C Driver |
| 39 | SEGD | Segment D Driver |
| 40 | SEGE | Segment E Driver |
| 41 | SEGF | Segment F Driver |
| 42 | SEGG | Segment G Driver |
| 43 | SEGDP | Segment Decimal-Point Driver |
| 44 | LED_EN | Active-High LED Enable. The MAX1366/MAX1368 display driver turns off when LED_EN is low. The MAX1366/MAX1368 LED-display driver turns on when LED_EN is high. |
| 45 | NEGV | -2.5V Charge-Pump Voltage Output. Connect a 0.14 F capacitor to GND. |
| 46 | LOWBATT | Low-Battery-Voltage Monitor. When the LOWBATT input voltage is lower than 2.048 V , the LOWBATT bit in the status register is set to one. |
| 47 | REF- | Negative Reference Voltage Input. For internal reference operation, connect REF- to GND. For external reference operation, bypass REF- to GND with a $0.1 \mu \mathrm{~F}$ capacitor and set $\mathrm{V}_{\text {REF- }}$ from -2.2 V to +2.2 V ( $\mathrm{V}_{\mathrm{REF}}+>\mathrm{V}_{\text {REF- }}$ ). |
| 48 | REF+ | Positive Reference Voltage Input. For internal reference operation, connect a $4.7 \mu \mathrm{~F}$ capacitor from REF+ to GND. For external reference operation, bypass REF+ to GND with a $0.1 \mu \mathrm{~F}$ capacitor and set $\mathrm{V}_{\text {REF }}$ from -2.2 V to +2.2 V , provided that $\mathrm{V}_{\text {REF }}>\mathrm{V}_{\text {REF-. }}$ |

# Microcontroller-Interface, 4.5-/3.5-Digit Panel Meters with 4-20mA Output 

Functional Diagram

## Detailed Description

The MAX1366/MAX1368 low-power, highly integrated ADCs with LED drivers convert a $\pm 2 \mathrm{~V}$ differential input voltage (one count is equal to $100 \mu \mathrm{~V}$ for the MAX1366 and 1 mV for the MAX1368) with a sigma-delta ADC and output the result to an LED display. An additional $\pm 200 \mathrm{mV}$ input range (one count is equal to $10 \mu \mathrm{~V}$ for the MAX1366 and $100 \mu \mathrm{~V}$ for the MAX1368) is available to measure small signals with finer resolution.
In addition to displaying the results on an LED display, these devices feature a DAC and V-to-I converter for 4-20mA (or 0 to 16 mA ) current output that proportionally follows the ADC input. The MAX1366/MAX1368 use an external depletion-mode nMOS transistor to regulate 7 V to 30 V for the $\mathrm{V} / \mathrm{I}$ converter. Use the $4-20 \mathrm{~mA}$ (or 0 to 16 mA ) output to drive a remote display, data logger, PLC input, or other 4-20mA devices in a current loop.
The MAX1366/MAX1368 interface with a $\mu \mathrm{C}$ using an SPI-/QSPI-/MICROWIRE-compatible serial interface.

For added flexibility, the MAX1366/MAX1368 allow direct access to the ADC register, LED display register, and DAC output register using the SPI interface.
The MAX1366/MAX1368 include a 2.048 V reference, internal charge pump, and a high-accuracy on-chip oscillator. The devices feature on-chip buffers for the differential input signal and external-reference inputs, allowing direct interface with high-impedance signal sources. In addition, they use continuous internal offset calibration and offer > 100 dB of 50 Hz and 60 Hz linenoise rejection. Other features include data hold and peak detection and overrange/underrange detection.

## Analog Input Protection

The MAX1366/MAX1368 provide internal protection diodes that limit the analog input range on AIN+, AIN-, $R E F+$, and REF- from NEGV to (AVDD + 0.3V). If the analog input exceeds this range, limit the input current to 10 mA .

# Microcontroller-Interface, 4.5-/3.5-Digit Panel Meters with 4-20mA Output 

## Internal Analog Input/Reference Buffers

The MAX1366/MAX1368 analog input/reference buffers allow the use of high-impedance signal sources. The input buffers' common-mode input range allows the ana$\log$ inputs and the reference to range from -2.2 V to +2.2 V .

## Modulator

The MAX1366/MAX1368 perform analog-to-digital conversions using a single-bit, 3rd-order, sigma-delta modulator. The sigma-delta modulator converts the input signal into a digital pulse train whose average duty cycle represents the digitized signal information. The modulator quantizes the input signal at a much higher sample rate than the bandwidth of the input. The MAX1366/MAX1368 modulator provides 3rd-order frequency shaping of the quantization noise resulting from the single-bit quantizer. The modulator is fully differential for maximum signal-to-noise ratio and minimum susceptibility to power-supply noise. A single-bit data stream is then presented to the digital filter to remove the frequency-shaped quantization noise.

## Digital Filtering

The MAX1366/MAX1368 contain an on-chip digital lowpass filter that processes the data stream from the modulator using a SINC $^{4}$ response:

$$
\left(\frac{\sin (x)}{x}\right)^{4}
$$

The SINC4 filter has a settling time of four output data periods ( $4 \times 200 \mathrm{~ms}$ ). The MAX1366/MAX1368 have $25 \%$ overrange capability built into the modulator and digital filter. The digital filter is optimized for the fCLK equal to 4.9152 MHz . The frequency response of the SINC ${ }^{4}$ filter is calculated as follows:

$$
\begin{aligned}
& H(z)=\left[\frac{1\left(1-Z^{-N}\right)}{N}\right]_{\left(1-Z^{-1}\right)}^{4} \\
& H(f)=\frac{1}{N}\left[\frac{\sin \left(N \pi \frac{f}{f_{m}}\right)}{\sin \left(\frac{\pi f}{f_{m}}\right)}\right]^{4}
\end{aligned}
$$

where $N$ is the oversampling ratio, and $f_{m}=N \times$ output data rate $=5 \mathrm{~Hz}$.

Filter Characteristics
Figure 1 shows the filter frequency response. The SINC ${ }^{4}$ characteristic -3dB cutoff frequency is 0.228 times the first notch frequency ( 5 Hz ). The oversampling

Figure 1. Frequency Response of the SINC ${ }^{4}$ Filter (Notch at 60Hz)
ratio (OSR) for the MAX1368 is 128 and the OSR for the MAX1366 is 1024. The output data rate for the digital filter corresponds to the positioning of the first notch of the filter's frequency response. The notches of the SINC4 filter are repeated at multiples of the first notch frequency. The SINC ${ }^{4}$ filter provides an attenuation of better than 100 dB at these notches. For example, 50 Hz is equal to 10 times the first notch frequency and 60 Hz is equal to 12 times the first notch frequency. For large step changes at the input, allow a settling time of 800 ms before valid data is read.

## Clock Modes

Configure the MAX1366/MAX1368 to use either the internal oscillator or an externally applied clock to drive the modulator, filter, and DAC. Set the EXTCLK bit in the control register to zero to put the device in internal clock mode. Set the EXTCLK bit to one to put the device in external clock mode. When using the internal oscillator, connect CLK to GND or DVDD. The MAX1366/MAX1368 operate with a 4.9152 MHz clock to achieve maximum rejection of $50 \mathrm{~Hz} / 60 \mathrm{~Hz}$ commonmode, power-supply, and normal-mode noise.

## Internal Clock Mode

The MAX1366/MAX1368 contain an internal oscillator. The power-up condition for the MAX1366/MAX1368 is internal clock operation with the EXTCLK bit in the control register equal to zero. Using the internal oscillator saves board space by removing the need for an external clock source.

External-Clock Mode
For external clock operation, set the EXTCLK bit in the control register to one and drive CLK with a 4.9152 MHz

# Microcontroller-Interface, 4.5-/3.5-Digit Panel Meters with 4-20mA Output 

Figure 2. Segment Connection for the MAX1366 (4.5 Digits)

Figure 3. Segment Connection for the MAX1368 (3.5 Digits)
clock source for best $50 \mathrm{~Hz} / 60 \mathrm{~Hz}$ rejection performance. Other external clock frequencies allow for custom conversion rates. A 2.4576 MHz clock signal reduces the conversion rate and the LED update rate by a factor of two while keeping good $50 \mathrm{~Hz} / 60 \mathrm{~Hz}$ noise rejection. The MAX1366/MAX1368 operate with an external clock source of up to 5.05 MHz .

## Charge Pump

The MAX1366/MAX1368 contain an internal charge pump to provide the negative supply voltage for the internal analog input/reference buffers. The bipolar input range of the analog input/reference buffers allows this device to accept negative inputs with high source impedances. Connect a $0.1 \mu \mathrm{~F}$ capacitor from NEGV to GND.

## LED Driver (Table 1)

The MAX1366 has a 4.5-digit common-cathode display driver, and the MAX1368 has a 3.5 -digit common-cathode display driver.
Figures 2 and 3 show the connection schemes for a standard seven-segment LED display. The LED update rate is 2.5 Hz .
The MAX1366/MAX1368 automatically display the results of the ADC, if desired. The MAX1366/MAX1368 also allow independent control of the LED driver through the serial interface, allowing for data processing of the ADC result before showing the result on the LED. Additionally, each LED segment can be individually controlled (see the LED Segment-Display Register sections).

Table 1. LED Priority Table

| SEG_SEL | SPI/ADC | HOLD | PEAK | DISPLAY VALUES <br> FORM |
| :---: | :---: | :---: | :---: | :--- |
| 1 | X | X | X | LED segment <br> registers |
| 0 | 1 | X | X | LED display register <br> (user written) |
| 0 | 0 | 1 | X | LED display register |
| 0 | 0 | 0 | 1 | Peak register |
| 0 | 0 | 0 | 0 | ADC result register |

X = Don't care.
Figure 4 shows a typical common-cathode configuration for two digits. In common-cathode configuration, the cathodes of all LEDs in a digit are connected together. Each segment driver of the MAX1366/ MAX1368 connects to its corresponding LED's anodes. For example, segment driver SEGA connects to all LED segments designated as A. Similar configurations are used for other segment drivers.
The MAX1366/MAX1368 use a multiplexing scheme to drive one digit at a time. The scan rate is fast enough to make the digits appear to be lit. Figure 5 shows the data-timing diagram for the MAX1366/MAX1368 where $t$ is the display scan period (typically around $1 / 512 \mathrm{~Hz}$ or 1.9531 ms ). toN in Figure 5 denotes the amount of time each digit is on and is calculated as follows:

$$
\mathrm{t}_{\mathrm{ON}}=\frac{\mathrm{t}}{5}=\frac{1.95312 \mathrm{~ms}}{5}=390.60 \mu \mathrm{~s}
$$

## Decimal-Point Control

The MAX1366/MAX1368 allow for full decimal-point control and feature leading-zero suppression.
Use the DPON, DPSET1, and DPSET2 bits in the control register to set the value of the decimal point (Tables 2 and 3). The MAX1366/MAX1368 overrange and underrange display is shown in Table 4.

## Current Output

The MAX1366/MAX1368 feature a $4-20 \mathrm{~mA}$ ( 0 to 16mA) current output for driving remote panel meters, data loggers, and process controllers in industrial applications. The DAC output is proportional to the input of the ADC and LED display. In the simplest configuration, connect DAC_VOUT directly to CONV_IN to have the current output ( $4-20 \mathrm{~mA}$ or 0 to 16 mA ) follow the analog inputs.

## Microcontroller-Interface, 4.5-/3.5-Digit Panel Meters with 4-20mA Output

Figure 6. ADC and DAC Timing Diagram

Figure 7. Serial-Interface, 16-Bit, Write Timing Diagram
Custom signal conditioning can be inserted between DAC_VOUT and CONV_IN, or CONV_IN can be driven independently by a voltage source if desired. See Figures 20-23 for the transfer functions of the DAC and V/I converter.
Note: The MAX1366/MAX1368 expect a $6 \mathrm{k} \Omega$ (typ) source impedance from the voltage source driving CONV_IN.

## Current Offset

Set EN_I high for a current span of 4-20mA. Set EN_I low for a current span of 0 to 16 mA . See Table 5 for current output.

## Unipolar Mode

Set EN_BPM low to engage unipolar operation. In unipolar mode, the current output at $4-200 \mathrm{OT}$ ( $4-20 \mathrm{~mA}$ or 0 to 16 mA ) maps the analog input voltage ( 0 to 2 V or 0 to 200 mV ). Negative voltages at the analog input result in a 4 mA or OmA output, depending on the EN_I setting. See Table 5 for current output. See Figures 21 and 22.

## Table 4. LED During Overrange and Underrange Conditions

| CONDITION | MAX1368 | MAX1366 |
| :---: | :---: | :---: |
| Overrange | $1---$ | $1----$ |
| Underrange | $-1---$ | $-1---$ |

## Bipolar Mode

Set EN_BPM high to engage bipolar operation. In bipolar mode, the current output at $4-200 \mathrm{CT}$ ( $4-20 \mathrm{~mA}$ or 0 to 16 mA ) maps the analog input voltage ( $\pm 2 \mathrm{~V}$ or $\pm 200 \mathrm{mV}$ ). In bipolar mode, a OV analog input maps to midscale (12mA). See Table 5 for current output. Also see Figures 21 and 22.

Figure 17. MAX1366 Transfer Function- $\pm 200 \mathrm{mV}$ Range

### 5.2V Linear Regulator with Compensation

The MAX1366/MAX1368 feature a 5.2 V linear regulator. The 5.2 V regulator consists of an op amp and connections to an external depletion-mode FET. The 5.2 V regulator regulates the loop voltage that powers the voltage-to-current converter and the rest of the transmitter circuitry. The regulator output voltage is available at REG_VDD and is given by the equation:

$$
\mathrm{V}_{\text {REG_VDD }}=2.54 \times \mathrm{V}_{\text {REF }}
$$

Figure 18. MAX1368 Transfer Function- $\pm 200 \mathrm{mV}$ Range

Figure 19. MAX1368 Transfer Function- $\pm 2 \mathrm{~V}$ Range

The FET breakdown and saturation voltages determine the usable range of loop voltages (VEXT). The external FET parameters such as $V_{G S}$ (off), IDSS, and transconductance must be chosen so that the op amp output on the REG_FORCE pin can control the FET operating point while swinging in the range from VREG_AMP to REG_VDD. See the Selecting Depletion Mode FET section in the Applications Information section.
Connect a $0.1 \mu \mathrm{~F}$ capacitor between CMP and REG_FORCE to ensure stable operation of the regulator.

Figure 20. DAC Output Voltage vs. ADC Output Code

Figure 21. Output Current (4-200UT) vs. ADC Output Code (Current Offset Enabled)

## Leading-Zero Suppression

The MAX1366/MAX1368 include a leading-zero suppression circuitry to turn off unnecessary zeros. For example, when DPSET1 and DPSET2 = [0,0], 0.0 is displayed instead of 000.0 (MAX1366). This feature saves a substantial amount of power by not lighting unnecessary LEDs.

Figure 22. Output Current (4-200UT) vs. ADC Output Code (Current Offset Disabled)

Figure 23. 4-200UT Output Current vs. V/I Converter Input Voltage

## Interdigit Blanking

The MAX1366/MAX1368 also include interdigit-blanking circuitry. Without this feature, it is possible to see a faint digit next to a digit that is completely on. The interdigit-blanking circuitry prevents ghosting over into the next digit for a short period of time. The typical interdigit blanking time is $4 \mu \mathrm{~s}$.

# Microcontroller-Interface, 4.5-/3.5-Digit Panel Meters with 4-20mA Output 

## Applications Information

## Power-On Reset

At power-on, the serial interface, logic, LED drivers, digital filter, modulator, and DAC circuits reset. The registers return to their default values.

Serial Interface

The SPI/QSPI/MICROWIRE serial interface consists of a chip select ( $\overline{\mathrm{CS}}$ ), a serial clock (SCLK), a data in (DIN), a data out (DOUT), DAC chip select (CS_DAC), and an EOC output. $\overline{C S}$ and $\overline{C S}$ DAC enable access to registers in the MAX1366/MAX1368. $\overline{\mathrm{CS}}$ allows a read and write to all registers of the MAX1366/MAX1368 excluding the DAC register and $\overline{\text { CS_DAC }}$ enables a write to the DAC register (see Table 8). EOC provides an end-of-conversion signal with a period of 200 ms ( $f$ CLK $=$ 4.9152 MHz ). The MAX1366/MAX1368 update the ADC register when EOC goes high. Data is valid in the ADC register when EOC returns low. The serial interface provides access to 13 on-chip registers, allowing control to all the power modes and functional blocks. Table 6 lists the address and read/write accessibility of all the registers excluding the DAC register.
A logic-high on $\overline{\mathrm{CS}}$ and $\overline{\mathrm{CS}}$ _DAC tri-states DOUT and causes the MAX1366/MAX1368 to ignore any signals on SCLK and DIN. To clock data in or out of the internal shift register, drive $\overline{\mathrm{CS}}$ or $\overline{\mathrm{CS}} \overline{\mathrm{DAC}}$ low. SCLK synchronizes the data transfer. The rising edge of SCLK clocks DIN into the shift register, and the falling edge of SCLK clocks DOUT out of the shift register. DIN and DOUT are transferred MSB first (data is left justified). Figures $6-10$ show the detailed serial-interface timing diagrams for the 8 - and 16 -bit read/write operations.
All communication with the MAX1366/MAX1368, with exception of the DAC register, begins with a command byte on DIN, where the first logic one on DIN is recognized as the START bit (MSB) for the command byte. The following seven clock cycles load the command into a shift register. These 7 bits specify which of the
registers are accessed next, and whether a read or write operation takes place. Transitions on the serial clock after the command byte transfer, cause a write or read from the device until the correct number of bits have been transferred (8 or 16). Once this has occurred, the MAX1366/MAX1368 wait for the next command byte. $\overline{\mathrm{CS}}$ must not go high between data transfers. If $\overline{\mathrm{CS}}$ is toggled before the end of a write or read operation, the device mode may be unknown. Clock in 32 zeros to clear the device state and reset the interface so it is ready to receive a new command byte.
To write to the DAC register, pull $\overline{C S} \_\overline{D A C}$ low and clock in 16 data bits. Data bits are clocked in MSB first (see the DAC Operation section).

## On-Chip Registers (Excluding DAC Register)

The MAX1366/MAX1368 contain 12 on-chip registers. These registers configure the various functions of the device and allow independent reading of the ADC results and writing to the LED display. Table 6 lists the address and size of each register. The first of these registers is the status register. The 8 -bit status register contains the status flags for the ADC. The second register is the 16 -bit control register. This register sets the LED display controls, range modes, power-down modes, offset calibration, and the reset register function (CLR). The third register is the 16-bit overrange register, which sets the overrange limit of the analog input. The fourth register is the 16 -bit underrange register, which sets the underrange limit of the analog input. Registers 5 through 7 contain the display data for the individual segments of the LED. The eighth register contains the custom offset value. The ninth register contains the 16 MSBs of the ADC conversion result. The 10th register contains the LED data. The 11th register contains the peak analog input value. The last register contains the lower 4 LSBs of the 20-bit ADC conversion result.

## Microcontroller-Interface, 4.5-/3.5-Digit Panel Meters with 4-20mA Output

Table 6. Register-Address Table

| REGISTER | ADDRESS RS[4:0] | NAME | WIDTH | ACCESS |
| :---: | :---: | :--- | :---: | :---: |
| 1 | 00000 | Status register | 8 | Read only |
| 2 | 00001 | Control register | 16 | $R / \bar{W}$ |

## Command Byte (Write Only)

| MSB |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 |
| START(1) | R/ $\bar{W}$ | RS4 | RS3 | RS2 | RS1 | RS0 | X |

START: Start bit. The first 1 clocked into the MAX1366/ MAX1368 is the first bit of the command byte.
$\mathbf{( R / W}):$ Read/Write. Set this bit to 1 to read from the specified register. Set this bit to zero to write to the selected register. Note that certain registers are read
Status Register (Read Only)

| MSB |  |  |  |  |  |  |  |  | LSB |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| SIGN | OVER | UNDER | LOW_BATT | DRDY | 0 | 0 | 0 |  |  |

Default values: 00h

This register contains the status of the conversion results.
SIGN: Latched negative-polarity indicator. Latches high when the result is negative. Clears by reading the status register, unless the condition remains true.
OVER: Overrange bit. Latches high if an overrange condition occurs (the ADC result is larger than the value in the overrange register). Clears by reading the status register, unless the condition remains true.
UNDER: Underrange bit. Latches high if an underrange condition occurs (the ADC result is less than the
value in the underrange register). Clears by reading the status register, unless the condition remains true.
LOW_BATT: Low-battery bit. Latches high if the voltage at the LOWBATT is lower than 2.048V (typ). Clears by reading the status register, unless the condition remains true.
DRDY: Data-ready bit. Latches high to indicate a completed conversion result with valid data. Read the ADC result register to clear this bit.

## Control Register (Read/Write)

| MSB |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit 15 | Bit 14 | Bit 13 | Bit 12 | Bit 11 | Bit 10 | Bit 9 | Bit 8 |
| SPI/ $\overline{\text { ADC }}$ | EXTCLK | INTREF | DPON | DPSET2 | DPSET1 | PD_DIG | PD_ANA |
| LSB |  |  |  |  |  |  |  |
| Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 |
| HOLD | PEAK | RANGE | CLR | SEG_SEL | $\overline{\text { OFFSET_CAL1 }}$ | OFFSET_ <br> CAL2 | ENABLE |

Default values: 0000h

This register is the primary control register for the MAX1366/MAX1368. It is a 16-bit read/write register. It is used to indicate the desired clock and reference source. It sets the LED display controls, range modes, power-down modes, offset calibration, and the reset register function (CLR).

ENABLE: (Default = 1.) LED driver enable bit. When set to 1, the MAX1366/MAX1368 enables the LED display drivers. A 0 in this location disables the LED display drivers.
OFFSET_CAL2: (Default = 0.) Enhanced offset-calibration start bit (RANGE $=1$ ). To achieve the lowest possible offset in the $\pm 200 \mathrm{mV}$ input range, perform an enhanced offset calibration by setting this bit to 1 . The calibration takes about nine cycles (1800ms). After the calibration completes, set this bit to zero to resume ADC conversions.

# Microcontroller-Interface, 4.5-/3.5-Digit Panel Meters with 4-20mA Output 

OFFSET_CAL1: (Default = 0.) Automatic offset-calibration enable bit. When set to 1, the MAX1366/ MAX1368 disable automatic offset calibration. When this bit is set to zero, automatic offset calibration is enabled.
SEG_SEL: (Default = 0.) SEG_SEL segment selection bit. When set to 1, the LED segment drivers use the LED segment registers to display individual segments that can form letters or numbers or other information on the display. The LED data register is not displayed. Send the data first to the LED segment-display registers and then set this bit high.
CLR: (Default = 0.) Clear all registers bit. When set to 1, all registers reset to their power-on reset states after $\overline{\mathrm{CS}}$ makes a low-to-high transition.
RANGE: (Default $=0$.) Input range select bit. When set to zero, the input voltage range is $\pm 2 \mathrm{~V}$. When set to 1 , the input voltage range is $\pm 200 \mathrm{mV}$.
PEAK: (Default $=0$.) Peak bit. When set to 1 (and the HOLD bit is set to zero), the LED shows the result stored in the peak register (see Table 6).
HOLD: (Default = 0.) Hold bit. When set to 1, the LED register does not update from the ADC conversion results and holds the last result on the LED. The MAX1366/MAX1368 continue to perform conversions during HOLD (Table 1).
PD_ANA: (Default = 0.) Power-down analog select bit. When set to 1, the analog circuits (analog modulator and ADC input buffers) go into the power-down mode. When set to zero, the device is in full power-up mode.

PD_DIG: (Default = 0.) Power-down digital select bit. When set to 1, the digital circuits (digital filter and LED drivers) go into power-down mode. This also resets the values of the internal SRAM in the digital filter to zeros. When set to zero, the device returns to full power-up mode. When powering down PD_DIG, power down the LED segment drivers by clearing the ENABLE bit to zero.
DPSET[2:1]: (Default = 00.) Decimal-point selection bits (Table 2 and 3).
DPON: (Default $=0$.) Decimal-point enable bit (Tables 2 and 3).
INTREF: (Default = 0.) Reference select bit. For internal reference operation, set INTREF to 1. For external reference operation, set INTREF to zero.
EXTCLK: (Default = 0.) External clock select bit. The EXTCLK bit controls selection of the internal clock or an external clock source. A 1 in this location selects the signal at the CLK input as the clock source. A zero in oscillator.
SPI/ADC: (Default $=0$.) Display select bit. The SPI/ADC bit controls selection of the data fed into LED data register. A 1 in this location selects SPI/QSPI/MICROWIRE data (user writes this data to the LED data register). A zero in this location selects the ADC result register data, unless hold or peak functions are active (Table 1).
Note: When changing any one of the following control bits: OFFSET_CAL1, RANGE, PD_ANA, PD_DIG, INTREF, and EXTCLK, wait 800 ms before reading the ADC results.

## Overrange Register (Read/Write)

| MSB | LSB |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| D15 | D14 | D13 | D12 | D11 | D10 | D9 | D8 | D7 | D6 | D5 | D4 | D3 | D2 | D1 | D0 |

Default values: $\quad$ 7CFOh (for 3.5-digit, +1999 )
4E1Fh (for 4.5-digit, +19,999)
The overrange register is a 16-bit read/write register (D15 is the MSB). When the conversion result exceeds the value in the overrange register, the OVER bit in the status register latches to 1 . The LED shows a 1 followed by four
dashes for the MAX1366 or a 1 followed by three dashes for the MAX1368 (Table 4).
The data is represented in two's-complement format.

# Microcontroller-Interface, 4.5-/3.5-Digit Panel Meters with 4-20mA Output 

## Underrange Register (Read/Write)

| MSB |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| D15 | D14 | D13 | D12 | D11 | D10 | D9 | D8 | D7 | D6 | D5 | D4 | D3 | D2 | D1 | D0 |

Default values: $\quad 8300 \mathrm{~h}$ (for 3.5-digit, -2000)
B1E0h (for 4.5-digit, -20,000)

The underrange data register is 16-bit read/write register (D15 is the MSB). When the conversion result falls below the value in the underrange register, the UNDR bit in the status register sets to 1 . The LED shows a -1
followed by four dashes for the MAX1366 or a -1 followed by three dashes for the MAX1368 (Table 4). The data is represented in two's-complement format. Default values: 0000h

LED Segment-Display Register 1 (Read/Write)

| MSB |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit 15 | Bit 14 | Bit 13 | Bit 12 | Bit 11 | Bit 10 | Bit 9 | Bit 8 |
| $\overline{\mathrm{A} 1}$ | $\overline{\mathrm{G} 1}$ | $\overline{\text { D1 }}$ | F1 | E1 | $\overline{\text { DP2 }}$ | X | $\overline{\mathrm{BO}}$ |
|  |  |  |  |  |  |  | LSB |
| Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 |
| $\overline{\mathrm{CO}}$ | $\overline{\mathrm{AO}}$ | $\overline{\mathrm{GO}}$ | $\overline{\text { D0 }}$ | $\overline{\text { FO }}$ | EO | $\overline{\text { DP1 }}$ | 0 |

LED segment-display register 1 is a 16-bit read/write register. When the LED bit (in the control register) is set to 1 , the MAX1366/MAX1368 provide direct access to individual LED segments. The bits in the LED segmentdisplay register determine if a segment is on or off. Write a zero to turn on a segment and a 1 to turn off a segment.
DP1: Segment DP driver bit of digit 1. The default value turns on the LED segment.
$\overline{\text { EO: }}$ : Segment E driver bit of digit 0 . The default value turns on the LED segment.
$\overline{\mathbf{F O}}$ : Segment F driver bit of digit 0 . The default value turns on the LED segment.
$\overline{\mathbf{D O}}$ : Segment D driver bit of digit 0 . The default value turns on the LED segment.
$\overline{\mathbf{G 0}}$ : Segment G driver bit of digit 0 . The default value turns on the LED segment.
$\overline{\mathbf{A 0}}$ : Segment $A$ driver bit of digit 0 . The default value turns on the LED segment.
$\overline{\mathbf{C O}}$ : Segment C driver bit of digit 0 . The default value turns on the LED segment.
$\overline{\mathbf{B 0}}$ : Segment B driver bit of digit 0 . The default value turns on the LED segment.
X: Don't care.
(DP2: Segment DP driver bit of digit 2. The default value turns on the LED segment.
$\overline{\mathbf{E 1}}$ : Segment E driver bit of digit 1. The default value turns on the LED segment.
$\overline{\mathrm{F} 1}$ : Segment F driver bit of digit 1. The default value turns on the LED segment.
(1): Segment D driver bit of digit 1. The default value turns on the LED segment.
G1: Segment G driver bit of digit 1. The default value turns on the LED segment.
$\overline{\mathbf{A 1}}$ : Segment A driver bit of digit 1. The default value turns on the LED segment.

# Microcontroller-Interface, 4.5-/3.5-Digit Panel Meters with 4-20mA Output 

LED Segment-Display Register 2 (Read/Write)

| MSB |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit 15 | Bit 14 | Bit 13 | Bit 12 | Bit 11 | Bit 10 | Bit 9 | Bit 8 |
| $\overline{\text { F3 }}$ | E3 | $\overline{\text { DP4 }}$ | $\overline{\text { MINUS }}$ | $\overline{\mathrm{B} 2}$ | $\overline{\mathrm{C} 2}$ | $\overline{\mathrm{A} 2}$ | $\overline{\mathrm{G} 2}$ |
|  |  |  |  |  |  |  | LSB |
| Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 |
| $\overline{\text { D2 }}$ | $\overline{\text { F2 }}$ | E2 | $\overline{\mathrm{DP3}}$ | X | $\overline{\text { B1 }}$ | $\overline{\mathrm{C} 1}$ | 0 |

Default values: 0000h

LED segment-display register 2 is a 16-bit read/write register. When the SEG_SEL bit (in the control register) is set to 1, the MAX1366/MAX1368 provide direct access to individual LED segments. The bits in the LED segment-display register determine if a segment is on or off. Write a zero to turn on a segment and a 1 to turn off a segment.
$\overline{\mathbf{C 1}}$ : Segment C driver bit of digit 1. The default value turns on the LED segment.
$\overline{\mathbf{B 1}}$ : Segment B driver bit of digit 1. The default value turns on the LED segment.
MINUS: Segment minus driver bit. The default value turns on the LED minus segment. Setting this bit to 1 enables the plus sign on the LED display.
$\overline{\text { DP3: }}$ Segment DP driver bit of digit 3. The default value turns on the LED segment.
E2: Segment E driver bit of digit 2. The default value turns on the LED segment.

F2: Segment F driver bit of digit 2. The default value turns on the LED segment.
$\overline{\mathbf{D 2}}$ : Segment D driver bit of digit 2. The default value turns on the LED segment.
G2: Segment G driver bit of digit 2. The default value turns on the LED segment.
(A2: Segment A driver bit of digit 2. The default value turns on the LED segment.
$\overline{\mathbf{C 2}}$ : Segment C driver bit of digit 2. The default value turns on the LED segment.
B2: Segment B driver bit of digit 2. The default value turns on the LED segment.
DP4: Segment DP driver bit of digit 4. The default value turns on the LED segment (MAX1366 only).
E3: Segment E driver bit of digit 3. The default value turns on the LED segment (MAX1366 only).
$\overline{\mathrm{F} 3}$ : Segment F driver bit of digit 3. The default value turns on the LED segment (MAX1366 only).

## LED Segment-Display Register 3 (Read/Write)

| MSB |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $X$ | $X$ | $\overline{\mathrm{BC}}$ | $\overline{\mathrm{B}}$ | $\overline{\mathrm{C}}$ | $\overline{\mathrm{A} 3}$ | $\overline{\mathrm{G} 3}$ | $\overline{\mathrm{D} 3}$ |

Default values: 00h

LED segment-display register 3 is an 8 -bit read/write register. When the SEG_SEL bit (in the control register) is set to 1 , the MAX1366/MAX1368 provide direct access to individual LED segments. The bits in the LED segment-display register determine if a segment is on or off. Write a zero to turn on a segment and a 1 to turn off a segment.
$\overline{\mathbf{D} 3:}$ Segment D driver bit of digit 3. The default value turns on the LED segment (MAX1366 only).
( $\overline{\mathbf{G 3}}$ : Segment G driver bit of digit 3. The default value turns on the LED segment (MAX1366 only).

A3: Segment A driver bit of digit 3. The default value turns on the LED segment (MAX1366 only).
$\overline{\mathbf{C 3}}$ : Segment C driver bit of digit 3. The default value turns on the LED segment (MAX1366 only).
$\overline{\mathbf{B 3}}$ : Segment B driver bit of digit 3. The default value turns on the LED segment (MAX1366 only).
BC_: Segment B and C driver bit of digit 3 ( 3.5 digits) or digit 4 ( 4.5 digits). The default value turns on the LED segment.
X: Don't care.

# Microcontroller-Interface, 4.5-/3.5-Digit Panel Meters with 4-20mA Output 

ADC Custom Offset-Calibration Register 3 (Read/Write)

| MSB | LSB |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| D15 | D14 | D13 | D12 | D11 | D10 | D9 | D8 | D7 | D6 | D5 | D4 | D3 | D2 | D1 | D0 |

Default values: 0000h

In addition to automatic offset calibration, the MAX1366/MAX1368 offer a user-defined custom offset 16 -bit read/write register. The final result of the ADC conversion is the input after autocalibration minus
the value in the custom offset. The custom offset value is stored in this register. D15 is the MSB. The data is represented in two's-complement format.

## ADC Result Register 1 (Read Only)

| MSB |  |  |  |  |  |  |  |  | $\begin{gathered} \text { LSB } \\ \text { (MAX1368) } \end{gathered}$ |  |  |  |  | $\begin{array}{r} \text { LSB } \\ \text { (MAX1366) } \end{array}$ |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| D15 | D14 | D13 | D12 | D11 | D10 | D9 | D8 | D7 | D6 | D5 | D4 | D3 | D2 | D1 | D0 |

Default values: 0000h

ADC result register 1 is a 16 -bit read-only register. This register stores the 16 MSBs of the ADC result. The data is represented in two's-complement format.

For the MAX1366, the data is 16 -bit and D15 is the MSB. For the MAX1368, the data is 12-bit, D15 is the MSB, and D4 is the LSB.

## ADC Result Register 2 (Read Only)

| MSB |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| D3 | D2 | D1 | D0 | 0 | 0 | 0 | 0 |

Default values: 00h

ADC result register 2 is an 8 -bit read-only register. This register stores the 4 LSBs of the ADC result.

Use this result with the result in ADC result register 1 to form a 20-bit two's-complement conversion result.

## LED Data Register (Read/Write)

| MSB |  |  |  |  |  |  |  |  | $\begin{gathered} \text { LSB } \\ \text { (MAX1368) } \end{gathered}$ |  |  |  |  | $\begin{array}{r} \text { LSB } \\ \text { (MAX1366) } \end{array}$ |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| D15 | D14 | D13 | D12 | D11 | D10 | D9 | D8 | D7 | D6 | D5 | D4 | D3 | D2 | D1 | D0 |

Default values: 0000h

The LED data register is a 16 -bit read/write register. This register updates from ADC result register 1 or from the serial interface by selecting the SPI/ADC bit in the control register. The data is represented in two's-complement format.

For the MAX1366, the data is 16 -bit and D15 is the MSB. For the MAX1368, the data is 12 -bit, D15 is the MSB, and D4 is the LSB, followed by 4 trailing sub-bits.

# Microcontroller-Interface, 4.5-/3.5-Digit Panel Meters with 4-20mA Output 

## LED Data Register (Read/Write)

| MSB |  |  |  |  |  |  |  |  | $\begin{gathered} \text { LSB } \\ \text { (MAX1368) } \end{gathered}$ |  |  |  |  | $\begin{array}{r} \text { LSB } \\ \text { (MAX1366) } \end{array}$ |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| D15 | D14 | D13 | D12 | D11 | D10 | D9 | D8 | D7 | D6 | D5 | D4 | D3 | D2 | D1 | DO |

Default values: B1EOh

The peak data register is a 16 -bit read-only register. Set the PEAK bit to 1 to enable the PEAK function. This register stores the peak value of the ADC conversion result. First, the current ADC result is saved to the PEAK register, then the new ADC conversion result is compared to this value. If the new value is larger than the value in the peak register, the MAX1366/MAX1368 save the new value to the peak register. If the new

## DAC Operation

For the MAX1366/MAX1368, a voltage proportional to the ADC input is available at DACVOUT. Connect DACVOUT to CONV_IN for normal operation. (See Figure 20 for DAC transfer function).
In normal operation, pull DACDATA_SEL low to use the ADC output as the DAC input. Pull DACDATA_SEL high to allow data to be written to the DAC register using the SPI/QSPI/MICROWIRE interface. Once DACDATA_SEL is pulled high, the three digital inputs (CS_DAC, DIN, and SCLK) load the digital input data serially into the DAC. (See Figure 11.)
To clock data into the DAC shift register, drive $\overline{\mathrm{CS}} \quad \overline{\mathrm{DAC}}$ low. SCLK synchronizes the data transfer. Immediately, following $\overline{C S}$ DAC high-to-low transition, the data shifts synchronously into the serial shift register on the rising edge of the serial clock input (SCLK). After 16 data bits have been loaded into the serial input register, the data latches to the DAC register on the rising edge of $\overline{C S} \_\overline{D A C}$. The DAC output updates on the next conversion clock ( 2.5 Hz ). DIN is transferred MSB first.

## Reference <br> ADC Reference

The MAX1366/MAX1368 reference sets the full-scale range of the ADC transfer function. With a nominal 2.048 V reference, the ADC full-scale range is $\pm 2 \mathrm{~V}$ with RANGE $=$ GND. With RANGE $=$ DVDD, the full-scale range is $\pm 200 \mathrm{mV}$. A decreased reference voltage decreases full-scale range (see the Transfer Functions section).
The MAX1366/MAX1368 accept either an external reference or an internal reference (INTREF). The INTREF logic selects the reference mode (see the Control
value is less than the value in the peak register, the value in the peak register remains unchanged. Set the PEAK bit to zero to clear the value in the PEAK register. The data is represented in two's-complement format. For the MAX1366, the data is 16 -bit and D15 is the MSB. For the MAX1368, the data is 12 -bit, D15 is the MSB, and D4 is the LSB followed by 4 trailing sub-bits.

Register (Read/Write) section). The default power-on state sets the MAX1366/MAX1368 to use the external reference with the INTREF bit cleared to zero.
For internal-reference operation, set the INTREF bit to one, connect REF- to GND, and bypass REF+ to GND with a $4.7 \mu \mathrm{~F}$ capacitor. The internal reference provides a nominal 2.048 V source between REF+ and GND. The internal-reference temperature coefficient is typically $40 \mathrm{ppm} /{ }^{\circ} \mathrm{C}$.
For external-reference operation, set INTREF to GND. REF+ and REF- are fully differential. For a valid externalreference input, $V_{\text {REF }}+$ must be greater than VREFBypass REF+ and REF- with a $0.1 \mu$ F or greater capacitor to GND in external-reference mode.
Figure 14 shows the MAX1366/MAX1368 operating with an external single-ended differential reference. In this figure, REF- is connected to the top of the strain gauge and REF+ is connected to the midpoint of the resistor-divider of the supply.
Figure 15 shows the MAX1366/MAX1368 operating with an external single-ended reference. In this figure, REFis connected to GND and REF+ is driven with an external 2.048 V reference. Bypass REF+ to GND with a $0.1 \mu \mathrm{~F}$ capacitor.

DAC Reference
The DAC of the MAX1366/MAX1368 accepts either an external reference or an internal reference. For externalreference operation, disable the DAC reference buffer by setting REFSELE to $\mathrm{DV}_{\mathrm{DD}}$ and connect a voltage source to REF_DAC.
For internal-reference operation, enable the DAC reference buffer by setting REFSELE to GND. In this mode, leave REFDAC floating.

# Microcontroller-Interface, 4.5-/3.5-Digit Panel Meters with 4-20mA Output 

In either internal or external reference operation, bypass REF_DAC with a $0.1 \mu \mathrm{~F}$ capacitor to GND. Choose a reference with output impedance (load regulation equivalent) of $100 \mathrm{~m} \Omega$ or less, such as the MAX6126. For best performance, use an external source from the ADC and DAC.

## Offset Calibration

The MAX1366/MAX1368 offer on-chip offset calibration. The device offset calibrates during every conversion when the OFFSET_CAL1 bit is zero in the control register. Enhanced offset calibration is only needed in the MAX1366 when the RANGE bit $=1$. It is performed on demand by setting the OFFSET_CAL2 bit to 1.

Enhanced Offset Calibration
Enhanced offset calibration is a more accurate calibration method that is needed in the case of the $\pm 200 \mathrm{mV}$ range and 4.5-digit resolution. The MAX1366 performs enhanced calibration on demand by setting the OFFSET_CAL2 bit to 1.

Power-Down Modes
The MAX1366/MAX1368 feature independent power-down control of the analog and digital LED driver's circuitry.
Writing a 1 to the PD_DIG and PD_ANA bits in the control word, powers down the analog and digital circuitry, reducing the supply current to $268 \mu \mathrm{~A}$ (typ). PD_DIG powers down the digital filter, while PD_ANA powers down the analog modulator and ADC input buffers. Writing a zero to the ENABLE bit in the control word powers down the LED drivers.

Peak
The MAX1366/MAX1368 feature peak-detection circuitry. When activated (PEAK bit $=1$ ), the devices display only the highest voltage measured to the LED.

Hold
The MAX1366/MAX1368 feature data-hold circuitry. When activated (HOLD bit $=1$ ), the device holds the current reading on the LED.

Low Battery
The MAX1366/MAX1368 feature a low-battery detection input. When the voltage at LOWBATT drops below 2.048 V (typ), LOWBATT in the status register goes high.

Strain-Gauge Measurement Connect the differential inputs of the MAX1366/ MAX1368 to the bridge network of the strain gauge. In Figure 14, the analog supply voltage powers the bridge network and the MAX1366/MAX1368, along with the reference voltage. The MAX1366/MAX1368 handle an analog input voltage range of $\pm 200 \mathrm{mV}$ and $\pm 2 \mathrm{~V}$ full scale. The analog/reference inputs of the parts allow
the analog input range to have an absolute value of anywhere between -2.2 V and +2.2 V .

## Thermocouple Measurement

Figure 15 shows a connection from a thermocouple to the MAX1366/MAX1368. In this application, the MAX1366/MAX1368 take advantage of the on-chip input buffers that allow large source impedances on the front end. The decoupling capacitors reduce noise pickup from the thermocouple leads. To place the differential voltage from the thermocouple at a suitable commonmode voltage, the AIN- input of the MAX1366/MAX1368 is biased to GND. Use an external temperature sensor, such as the DS75, and a microcontroller to perform coldjunction temperature compensation.

## Transfer Functions

ADC Transfer Functions
Figures 16-19 show the transfer functions of the MAX1366/MAX1368. The output data is stored in the ADC data register in two's complement.
The transfer function for the MAX1366 with AIN+ - AIN$\geq 0$ and RANGE $=$ GND is:
(1) COUNT $=1.024\left(\frac{V_{\text {AIN }+}-V_{\text {AIN }-}}{V_{\text {REF }+}-V_{\text {REF- }}} \times 20,000\right)$

The transfer function for the MAX1366 with AIN+ - AIN$<0$ and RANGE $=$ GND is:
(2) COUNT $=1.024\left(\frac{V_{\text {AIN }+}-V_{\text {AIN- }}}{V_{\text {REF }+}-V_{\text {REF- }}} \times 20,000\right)+1$

The transfer function for the MAX1368 with AIN+ - AIN$\geq 0$ and RANGE = GND is:
(3) COUNT $=1.024\left(\frac{V_{\text {AIN }+}-V_{\text {AIN- }}}{V_{\text {REF }+}-V_{\text {REF- }}} \times 2000\right)$

The transfer function for the MAX1368 with AIN+ - AIN$<0$ and RANGE $=$ GND is:
(4) COUNT $=1.024\left(\frac{V_{\text {AIN }+}-V_{\text {AIN- }}}{V_{\text {REF }+}-V_{\text {REF- }}} \times 2000\right)+1$

The transfer function for the MAX1366 with AIN+ - AIN$\geq 0$ and RANGE $=D V_{D D}$ is:
(5) $\mathrm{COUNT}=1.024\left(\frac{\mathrm{~V}_{\text {AIN }+}-\mathrm{V}_{\text {AIN }-}}{\mathrm{V}_{\text {REF }+}-\mathrm{V}_{\text {REF- }}} \times 20,000\right) \times 10$

# Microcontroller-Interface, 4.5-/3.5-Digit Panel Meters with 4-20mA Output 

The transfer function for the MAX1366 with AIN+ - AIN$<0$ and RANGE $=$ DVDD is:
(6) COUNT $=1.024\left(\frac{V_{\text {AIN }+}-V_{\text {AIN- }}}{V_{\text {REF }+}-V_{\text {REF- }}} \times 20,000\right) \times 10+1$ The transfer function for the MAX1368 with AIN+ - AIN$\geq 0$ and RANGE $=$ DVDD is:
(7) COUNT $=1.024\left(\frac{V_{\text {AIN }+}-V_{\text {AIN- }}}{V_{\text {REF }+}-V_{\text {REF- }}} \times 2000\right) \times 10$

The transfer function for the MAX1368 with AIN+ - AIN$<0$ and RANGE $=$ DVDD is:
(8) COUNT $=1.024\left(\frac{V_{\text {AIN }+}-V_{\text {AIN- }}}{V_{\text {REF }+}-V_{\text {REF- }}} \times 2000\right) \times 10+1$

## DAC Transfer Functions

Figure 20 shows the DAC transfer function for the MAX1366/MAX1368 in unipolar and bipolar modes.
The transfer function for the DAC in the MAX1366/ MAX1368 unipolar mode is:

Note: The input at $\mathrm{V}_{\text {CONV_IN }}$ expects a source impedence of typically $6 \mathrm{k} \Omega$ when driving $\mathrm{V}_{\mathrm{CONV}}$ _IN externally.

$$
\mathrm{V}_{\text {DACVOUT }}=\frac{\mathrm{N}}{32,768-1} \times \mathrm{V}_{\mathrm{REF}}
$$

where $\mathrm{N}=$ two's complement ADC output code.
In unipolar mode, VDACVOUT is equal to OV for all two's complement ADC codes less than zero (see Figure 21).
The transfer function for the DAC in the MAX1366/ MAX1368 in bipolar mode is:

$$
\mathrm{V}_{\text {DACVOUT }}=\frac{\mathrm{N}+19,999}{6536} \times \mathrm{V}_{\text {REF }}
$$

where $\mathrm{N}=$ two's complement ADC output.

## Writing into the DAC Independently

A user can independently write to the DAC but cannot input codes greater than $+19,999$ or less than -19,999. In bipolar mode, a -19,999 DAC code provides 4 mA (OmA) output current and a $+19,999$ DAC code provides a $20 \mathrm{~mA}(16 \mathrm{~mA})$ output current.

## Voltage-to-Current Transfer Function

Figures 20 and 21 show the MAX1366/MAX1368 transfer function of the output current (4-200UT) versus the ADC output code.

Figure 23 shows the MAX1366/MAX1368 transfer function of the output current (4-200UT) versus the input voltage of the $\mathrm{V} / \mathrm{I}$ converter.
The transfer function for the MAX1366/MAX1368 with the current offset enabled (EN_I is high) is:

$$
\text { IOUT } \cong \frac{16 m A}{1.25} \times V_{C O N V}{ }^{2} \mathrm{IN}+4 \mathrm{~mA}
$$

The transfer function for the MAX1366/MAX1368 with the current offset disabled (EN_I is low) is:

$$
\mathrm{IOUT} \cong \frac{16 \mathrm{~mA}}{1.25} \times \mathrm{V}_{\mathrm{CONV} \_ \text {IN }}
$$

Supplies, Layout, and Bypassing Power up AVDD and DVDD before applying an analog input and external-reference voltage to the device. If this is not possible, limit the current into these inputs to 50 mA . When the analog and digital supplies come from the same source, isolate the digital supply from the analog supply with a low-value resistor (10 ) or ferrite bead. For best performance, ground the MAX1366/ MAX1368 to the analog ground plane of the circuit board. Avoid running digital lines under the device as this can couple noise onto the IC. Run the analog ground plane under the MAX1366/MAX1368 to minimize coupling of digital noise. Make the power-supply lines to the MAX1366/MAX1368 as wide as possible to provide low-impedance paths and reduce the effects of glitches on the power-supply line. Shield fast-switching signals, such as clocks, with digital ground to avoid radiating noise to other sections of the board. Avoid running clock signals near the analog inputs. Avoid crossover of digital and analog signals. Running traces that are on opposite sides of the board at right angles to each other reduces feedthrough effects. A microstrip technique is best, but is not always possible with dou-ble-sided boards. With this technique, the component side of the board is dedicated to ground planes while signals are placed on the solder side. Good decoupling is important when using high-resolution ADCs. Decouple the supplies with $0.1 \mu \mathrm{~F}$ ceramic capacitors to GND. Place these components as close to the device as possible to achieve the best decoupling.

Selecting Segment Current A resistor from ISET to ground sets the current for each LED segment. See Table 7 for more detail. Use the following formula to set the segment current:

$$
I_{S E G}=\left(\frac{1.20 \mathrm{~V}}{R_{I S E T}}\right) \times 400
$$

# Microcontroller-Interface, 4.5-/3.5-Digit Panel Meters with 4-20mA Output 

RISET values below $25 k \Omega$ increase the ISEG. However, the internal current-limit circuit limits the ISEG to less than 30 mA . At higher ISEG values, proper operation of the device is not guaranteed. In addition, the power dissipated may exceed the package power-dissipation limit.

## Choosing Supply Voltage to Minimize Power Dissipation

The MAX1366/MAX1368 drive a peak current of 25.5 mA into LEDs with a 2.2 V forward-voltage drop when operated from a supply voltage of at least 3.0V. Therefore, the minimum voltage drop across the internal LED drivers is $0.8 \mathrm{~V}(3.0 \mathrm{~V}-2.2 \mathrm{~V}=0.8 \mathrm{~V})$. The MAX1366/MAX1368 sink when the outputs are operating and the LED segment drivers are at full current $(8 \times 25.5 \mathrm{~mA}=204 \mathrm{~mA})$. For a 3.3V supply, the MAX1366/MAX1368 dissipate 224.4 mW $((3.3 \mathrm{~V}-2.2 \mathrm{~V}) \times 204=224.4 \mathrm{~mW})$. If a higher supply voltage is used, the driver absorbs a higher voltage, and the driver's power dissipation increases accordingly. However, if the LEDs used have a higher forward-voltage drop than 2.2 V , the supply voltage must be raised accordingly to ensure that the driver always has at least 0.8 V headroom. For an LEDV supply voltage of 2.7 V , the maximum LED forward voltage is 1.9 V to ensure 0.8 V driver headroom. The voltage drop across the drivers with a nominal +5 V supply ( $5.0 \mathrm{~V}-2.2 \mathrm{~V}=2.8 \mathrm{~V}$ ) is almost three times the drop across the drivers with a nominal 3.3 V supply ( $3.3 \mathrm{~V}-2.2 \mathrm{~V}=1.1 \mathrm{~V}$ ). Therefore, the driver's power dissipation increases three times. The power dissipation in the part causes the junction temperature to rise accordingly. In the high ambient temperature case, the total junction temperature may be very high (> $+125^{\circ} \mathrm{C}$ ). At higher junction temperatures, the ADC performance degrades. To ensure the dissipation limit for the MAX1366/MAX1368 is not exceeded and the ADC performance is not degraded; a diode can be inserted between the power supply and LEDV.

## Selecting Depletion-Mode FET

An external depletion-mode FET (DMOS) works in conjunction with the regulator circuit to supply the V/I converter with loop power. REG_FORCE regulates the gate of the DMOS so that the drain voltage is 5.2 V (typ) and allows the $4-20 \mathrm{~mA}(0$ to 16 mA ) loop to be directly powered from a 7 V to 30 V supply. DMOS IDS consists of the current output at 4-200UT, a 4mA offset current, and 1 mA (typ) consumed by the $\mathrm{V} / \mathrm{I}$ converter.
For offset-enabled mode (EN_I = 1):

$$
\mathrm{IDS}=\mathrm{I}_{4-200 U T}+4 \mathrm{~mA}+1 \mathrm{~mA}
$$

For offset-disabled mode (EN_I = 0):

$$
\mathrm{IDS}=14-200 U T+1 \mathrm{~mA}
$$

where IDS is the current in the DMOS.

Table 9 provides the FET characteristics for selecting an external DMOS transistor. The DN25D FET transistor from Supertex meets all the requirements of Table 7. Other suitable transistors include ND2020L and ND2410L from Siliconix.

Connect a $0.1 \mu \mathrm{~F}$ capacitor between CMP and REG_FORCE to ensure stable regulator compensation.

## Definitions

Integral Nonlinearity (INL)
INL is the deviation of the values on an actual transfer function from a straight line. This straight line is either a best-straight-line fit or a line drawn between the end points of the transfer function, once offset and gain errors have been nullified. INL for the MAX1366/ MAX1368 is measured using the end-point method.

## Differential Nonlinearity (DNL)

DNL is the difference between an actual step width and the ideal value of $\pm 1 \mathrm{LSB}$. A DNL error specification of less than $\pm 1$ LSB guarantees no missing codes and a monotonic transfer function.

Rollover Error Rollover error is defined as the absolute-value difference between a near positive full-scale reading and near negative full-scale reading. Rollover error is tested by applying a full-scale positive voltage, swapping AIN+ and AIN-, and adding the results.

## Zero-Input Reading

Ideally, with AIN+ connected to AIN-, the MAX1366/ MAX1368 LED displays zero. Zero-input reading is the measured deviation from the ideal zero and the actual measured point.

Gain Error
Gain error is the amount of deviation between the measured full-scale transition point and the ideal full-scale transition point.

Common-Mode Rejection (CMR) CMR is the ability of a device to reject a signal that is common to both input terminals. The common-mode signal can be either an AC or a DC signal or a combination of the two. CMR is often expressed in decibels.

## Normal-Mode 50Hz and 60Hz Rejection (Simultaneously)

Normal-mode rejection is a measure of how much output changes when 50 Hz and 60 Hz signals are injected into only one of the differential inputs. The MAX1366/ MAX1368 sigma-delta converter uses its internal digital filter to provide normal-mode rejection to both 50 Hz and 60 Hz power-line frequencies simultaneously.

# Microcontroller-Interface, 4.5-/3.5-Digit Panel Meters with 4-20mA Output 

Power-Supply Rejection (PSR)-ADC
PSR is a measure of the data converter's level of immunity to power-supply fluctuations. PSR assumes that the converter's linearity is unaffected by changes in the power-supply voltage. Power-supply rejection ratio (PSRR) is the ratio of the input signal change to the change in the converter output. PSRR is typically measured in dB .

Power-Supply Rejection-V/I Converter
PSR is a measure of the data converter's level of immunity to power-supply fluctuations. PSR assumes that the converter's linearity is unaffected by changes in the power-supply voltage. Note that the V/I converter current output ( $4-20 \mathrm{~mA}$ ) power-supply rejection is with respect to the 7 V to 30 V loop supply.
