FUNCTIONAL DESCRIPTION

The L9616 is used as an interface between a CAN controller and the physical bus. The device provides transmitting capability to the CAN controller.

The transmitter outputs C_H and C_L are protected against short circuits and electrical transients which may occur in an automotive environment. In case of short circuit (C_H to C_L, C_H to B) the protection circuit recognizes this fault conditionand the transmitter output stages are disabled with a delay of max. 10µs to prevent destruction of the IC and high consumption of supply current I_S. If V_{C_L} >V_{C_Lmax} the transmitter output stages would be disabled immediately.

Pin ASC makes it possible to select two different modes of operation: High speed (≤1MEGABaud) and low speed (≤250kBaud).

The ASC pin is tied to GND for normal operation at ≤1MEGABaud. For slower speed operation at ≤250kBaud the rise and fall slope of the bus output can be decreased to reduce EMI by connectingg the ASC pin to V_S.
