

DS34LV86T

3V Enhanced CMOS Quad Differential Line Receiver

General Description

The DS34LV86T is a high speed quad differential CMOS receiver that meets the requirements of both TIA/EIA-422-B and ITU-T V.11. The CMOS DS34LV86T features typical low static I_{CC} of 9 mA which makes it ideal for battery powered and power conscious applications. The TRI-STATE® enables, EN, allow the device to be disabled when not in use to minimize power consumption. The dual enable scheme allows for flexibility in turning receivers on and off.

The receiver output (RO) is guaranteed to be High when the inputs are left open. The receiver can detect signals as low as ± 200 mV over the common mode range of ± 10 V. The receiver outputs (RO) are compatible with TTL and LVCMOS levels.

Note 1: "Absolute Maximum Ratings" are those values beyond which the safety of the device cannot be guaranteed. They are not meant to imply that the devices should be operated at these limits. The table of "Electrical Characteristics" specifies conditions of device operation.

Note 2: Current into device pins is defined as positive. Current out of device pins is defined as negative. All voltages are referenced to ground except V_{ID} .

Note 3: All typicals are given for: $V_{CC} = +3.3V$, $T_A = +25^\circ C$.

Note 4: Short one output at a time to ground. Do not exceed package power dissipation ratings.

Note 5: t_{SK1} is the $|t_{PHL} - t_{PLH}|$ of a channel.

Note 6: t_{SK2} is the maximum skew between any two channels within a device, on either edge.

Note 7: t_{SK3} is the difference in propagation delay times between any channels of any devices. This specification (maximum limit) applies to devices within $V_{CC} \pm 0.1V$ of one another, and a $\Delta T_A = \pm 5^\circ C$ (between devices) within the operating temperature range. This parameter is guaranteed by design and characterization.

Note 8: All channels switching, output duty cycle criteria is 40%/60% measured at 50% Input = 1V to 2V, 50% Duty Cycle, $t_r/t_f \leq 5$ ns. This parameter is guaranteed by design and characterization.

Typical Application Information

General application guidelines and hints for differential drivers receivers may be found in the following application notes:

AN-214, AN-457, AN-805, AN-847, AN-903, AN-912, AN-916

Power Decoupling Recommendations: Bypass caps must be used on power pins. High frequency ceramic (surface mount

is recommended) 0.1 μF in parallel with 0.01 μF at the power supply pin. A 10 μF or greater solid tantalum or electrolytic should be connected at the power entry point on the printed circuit board.
