

### General Description

The MIC58P42 serial-input latched driver is a high-voltage (80V), high-current (500mA) integrated circuit comprised of eight CMOS data latches, a bipolar Darlington transistor driver for each latch, and CMOS control circuitry for the common STROBE, CLOCK, SERIAL DATA INPUT, and OUTPUT ENABLE functions. Similar to the MIC5842, additional protection circuitry supplied on this device includes thermal shutdown, under voltage lockout (UVLO), and over-current shutdown.

The bipolar/CMOS combination provides an extremely low-power latch with maximum interface flexibility. The MIC58P42 has open-collector outputs capable of sinking 500 mA and integral diodes for inductive load transient suppression with a minimum output breakdown voltage rating of 80V (50V sustaining). The drivers can be operated with a split supply, where the negative supply is down to -20V and may be paralleled for higher load current capability.

With a 5V logic supply, the MIC58P42 will typically operate at better than 5MHz. With a 12V logic supply, significantly higher speeds are obtained. The CMOS inputs are compatible with standard CMOS, PMOS, and NMOS circuits. TTL circuits may require pull-up resistors. By using the serial data output, drivers may be cascaded for interface applications requiring additional drive lines.

Each of these eight outputs has an independent over current shutdown of 500 mA. Upon over-current detection, the affected channel will turn OFF until  $V_{DD}$  is cycled or the ENABLE/RESET pin is pulsed high. Current pulses less than 2 $\mu$ s will not activate current shutdown. Temperatures above 165°C will shut down the device. The UVLO circuit prevents operation at low  $V_{DD}$ ; hysteresis of 0.5V is provided. See the MIC59P60 for a similar device that additionally provides an error flag output.

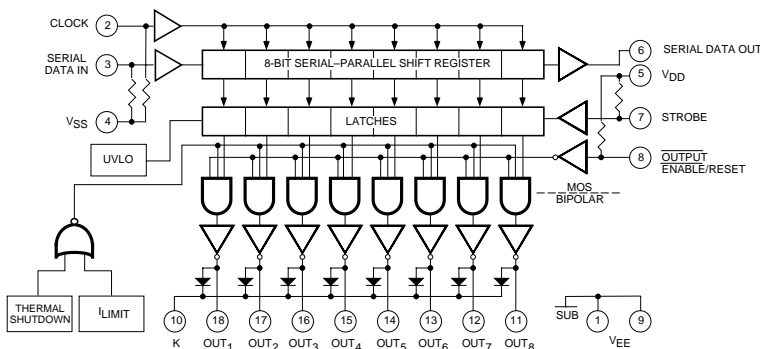

### Features

- 3.3 MHz Minimum Data-Input Rate
- CMOS, PMOS, NMOS, and TTL Compatible
- Internal Pull-Up/Pull-Down Resistors
- Low Power CMOS Logic and Latches
- High Voltage (80V) Current-Sink Outputs
- Output Transient-Protection Diodes
- Single or Split Supply Operation
- Thermal Shutdown
- Under-Voltage Lockout
- Per-Output Over-Current Shutdown (500mA typical)

## Pin Description

Pin (DIP & S.O.)	Name	Description
1,9	$V_{EE}$	Substrate. Most Negative voltage in the system connects here.
2	CLOCK	Serial Data Clock. A CLEAR input must also be clocked into the latches.
3	SERIAL DATA IN	Serial Data Input pin.
4	$V_{SS}$	Logic reference (Ground) pin.
5	$V_{DD}$	Logic Positive Supply voltage.
6	SERIAL DATA OUT	Serial Data Output pin. (Flow-through).
7	STROBE	Output Strobe pin. Loads output latches when high. Strobe is needed to clear latch.
8	$\overline{\text{OUTPUT}} \text{ ENABLE/RESET}$	When Low, Outputs are active. When High, device is reset from a fault condition.
10	K	Transient suppression diode's cathode common pin.
11—18	OUTPUT N	Open Collector outputs 8 through 1.
