## Universal Serial Bus Peripheral Transceiver with Voltage Regulator

### General Description

The USB1T1104 is an Universal Serial Bus Specification Rev 2.0 compliant transceiver. The device provides an USB interface for Full-Speed (12Mbit/s) USB applications. The USB1T1104 provides excellent flexibility, allowing differential and single ended inputs while an integrated voltage regulator sets the I/O level to 1.65V to 3.6V. Utilizing an integrated 5.0V to 3.3V voltage regulator, the part can be powered directly from the USB host ( $V_{BUS}$ ) to minimize the power consumed from the local sources while used in devices with low supply voltages.

The USB1T1104 provides 15kV ESD protection on the USB bus pins (D+/D-). This eliminates the need for any external ESD devices while providing excellent protection to larger and more expensive ASICs and USB controllers.

### Features

- Complies with Universal Serial Bus Specification 2.0
- Integrated 5V to 3.3V voltage regulator for powering VBus
- Utilizes digital inputs and outputs to transmit and receive USB cable data
- Supports full speed 12Mbits/s speed data rates
- Ideal for portable electronic devices
- 15kV contact HBM ESD protection on bus pins
- 3.3mm leadless package
- Industry standard HBCC footprint is lead-free

### Applications

- Cell phone
- Digital camera
- MP3

## Terminal Descriptions

Terminal Number	Terminal Name	I/O	Terminal Description
1	$\overline{OE}$	I	Output Enable: Active LOW enables the transceiver to transmit data on the bus. When not active the transceiver is in the receive mode (CMOS level is relative to $V_{CCIO}$ )
2	RCV	O	Receive Data Output: Non-inverted CMOS level output for USB differential Input (CMOS output level is relative to $V_{CCIO}$ ). Driven LOW when SUSPN is HIGH; RCV output is stable and preserved during SEO condition.
3	$V_p$	O	Single-ended D+ receiver output $V_p$ (CMOS level relative to $V_{CCIO}$ ): Used for external detection of SEO, error conditions, speed of connected device; Driven HIGH when no supply connected to $V_{CC}$ and $V_{REG}$ .
4	$V_m$	O	Single-ended D- receiver output $V_m$ (CMOS level relative to $V_{CCIO}$ ): Used for external detection of SEO, error conditions, speed of connected device; Driven HIGH when no supply connected to $V_{CC}$ and $V_{REG}$ .
5	SUSPND	I	Suspend: Enables a low power state (CMOS level is relative to $V_{CCIO}$ ). While the SUSPND pin is active (HIGH) it will drive the RCV pin to logic "0" state.
6	MODE	I	MODE input (CMOS level is relative to $V_{CCIO}$ ). A HIGH selects the differential input MODE ( $V_{po}$ , $V_{mo}$ ) whereas a LOW enables the single-ended MODE ( $V_o$ , $V_{FSEO}$ ) see Table 2 and Table 4
7	$V_{CCIO}$		Supply Voltage for digital I/O pins (1.65V to 3.6V): When not connected the D+ and D- pins are in 3-STATE. This supply bus is totally independent of $V_{CC}$ (5V) and $V_{REG}$ (3.3V).
8	Vbusmon	O	Vbus monitor output (CMOS level relative to $V_{CCIO}$ ): When $V_{bus} > 4.1V$ then $V_{busmon} = HIGH$ and when $V_{bus} < 3.6V$ then $V_{busmon} = LOW$ .
10, 9	D+, D-	A/I/O	Data +, Data -: Differential data bus conforming to the USB standard.
11	$V_{po} / V_o$	I	Driver Data Input (CMOS level is relative to $V_{CCIO}$ ); Schmitt trigger input; see Table 2 and Table 3
12	$V_{mo} / F_{SEO}$	I	Driver Data Input (CMOS level is relative to $V_{CCIO}$ ); Schmitt trigger input; see Table 2 and Table 3
13	$V_{REG}$ (3.3V)		Internal Regulator Option: Regulated supply output voltage (3.0V to 3.6V) during 5V operation; decoupling capacitor of at least 0.1 $\mu F$ is required.
14	$V_{CC}$ (5.0V)		Internal Regulator Option: Used as supply voltage input (4.0V to 5.5V); can be connected directly to USB line Vbus.
15	$V_{PU}$ (3.3V)		Pull-up Supply Voltage (3.3V $\pm$ 10%): Connect an external 1.5k $\Omega$ resistor on D+ (FS data rate); Pin function is controlled by Config input pin: Config = LOW - $V_{PU}$ (3.3V) is floating (High Impedance) for zero pull-up current. Config = HIGH - $V_{PU}$ (3.3V) = 3.3V; internally connected to $V_{REG}$ (3.3V).
16	Config	I	USB connect or disconnect software control input. Configures 3.3V to external 1.5k $\Omega$ resistor on D+ when HIGH.

Terminal Number	Terminal Name	I/O	Terminal Description
Exposed Diepad	GND	GND	GND supply down bonded to exposed diepad to be connected to the PCB GND.

## Functional Description

The USB1T1104 transceiver is designed to convert CMOS data into USB differential bus signal levels and to convert USB differential bus signal to CMOS data.

To minimize EMI and noise the outputs are edge rate controlled with the rise and fall times controlled and defined for full speed data rates. The rise, fall times are balanced between the differential pins to minimize skew.

Table 1 describes the specific pin functionality selection. Table 2, Table 3, and Table 4 describe the specific Truth Tables for Driver and Receiver operating functions.

The USB1T1104 also has the capability of various power supply configurations to support mixed voltage supply applications (see Table 5) and Power Supply Configurations and Options for detailed descriptions.

## Functional Tables

**TABLE 1. Function Select**

SUSPND	$\overline{OE}$	D+, D-	RCV	$V_p/V_m$	Function
L	L	Driving & Receiving	Active	Active	Normal Driving (Differential Receiver Active)
L	H	Receiving (Note 1)	Active	Active	Receiving
H	L	Driving	Inactive (Note 2)	Active	Driving during Suspend (Differential Receiver Inactive)
H	H	3-STATE (Note 1)	Inactive (Note 2)	Active	Low Power State

**Note 1:** Signal levels is function of connection and/or pull-up/pull-down resistors.

**Note 2:** For SUSPND = HIGH mode the differential receiver is inactive and the output RCV output is forced LOW. The out-of-suspend signaling (K) is detected via the single-ended receiver outputs of the  $V_p$  and  $V_m$  pins.

### Power Supply Configurations and Options

The three modes of power supply operation are:

- Normal Mode: Regulated Output

1. Regulated Output. V<sub>CCIO</sub> is connected and V<sub>CC</sub> (5.0) is connected to 5V (4.0V to 5.5V) and the internal voltage regulator then produces 3.3V for the USB connections.

For normal mode the V<sub>CCIO</sub> is an independent voltage source (1.65V to 3.6V) that is a function of the external circuit configuration.

- Sharing Mode: V<sub>CCIO</sub> is only supply connected. V<sub>CC</sub> and V<sub>REG</sub> are not connected. In this mode the D+ and D- pins are

3-STATE and the USB1T1104 allows external signals up to 3.6V to share the D+ and D- bus lines. Internally the circuitry limits leakage from D+ and D- pins (maximum 10 μA) and V<sub>CCIO</sub> such that device is in low power (suspended) state. Pins Vbusmon and RCV are forced LOW as an indication of this mode with Vbusmon being ignored during this state.

- Disable Mode: V<sub>CCIO</sub> is not connected and V<sub>CC</sub>(5V) is connected. In this mode the D+ and D- pins are 3-STATE and the device is in low power state.

A summary of the Supply Configurations is described in Table 5.

TABLE 5. Power Supply Configuration Options

Pins	Power Supply Mode Configuration		
	Sharing	Disable	Normal (Regulated Output)
V <sub>CC</sub> (5V)	< 3.6V	Connected to 5V Source	Connected to 5V Source
V <sub>REG</sub> (3.3V)	Pulled LOW Regulator OFF	3.3V, 300 μA Regulated Output	3.3V, 300 μA Regulated Output
V <sub>CCIO</sub>	1.65V to 3.6V Source	Not Connected	1.65V to 3.6V Source
V <sub>PU</sub> (3.3V)	3-STATE (Off)	3-STATE (Off)	3.3V Available if Config = HIGH

## Recommended Operating Conditions

DC Supply Voltage $V_{CC}$ (5V)	4.0V to 5.5V
I/O DC Voltage $V_{CCIO}$	1.65V to 3.6V
DC Input Voltage Range ( $V_I$ )	0V to $V_{CCIO} + 0.5V$
DC Input Range for A/I/O ( $V_{IA/O}$ )	0V to 3.6V
Pins D+ and D-	0V to 3.6V
Operating Ambient Temperature	
( $T_{AMB}$ )	-40°C to +85°C

**Note 6:** The Absolute Maximum Ratings are those values beyond which the safety of the device cannot be guaranteed. The device should not be operated at these limits. The parametric values defined in the Electrical Characteristic tables are not guaranteed at the absolute maximum rating. The "Recommended Operating Conditions" table will define the conditions for actual device operation.

**Note 7:** IO Absolute Maximum Rating must be observed.
