

Smart Highside Power Switch

One Channel: 20mΩ

Product Summary

On-state Resistance	RON	20mΩ
Operating Voltage	V _{bb(on)}	4.75 ... 41V
Nominal load current	I _{L(ISO)}	21A
Current limitation	I _{L(lim)}	65A

Package

General Description

- N channel vertical power FET with charge pump, ground referenced CMOS compatible input, monolithically integrated in Smart SIPMOS® technology.
- Providing embedded protective functions.

Application

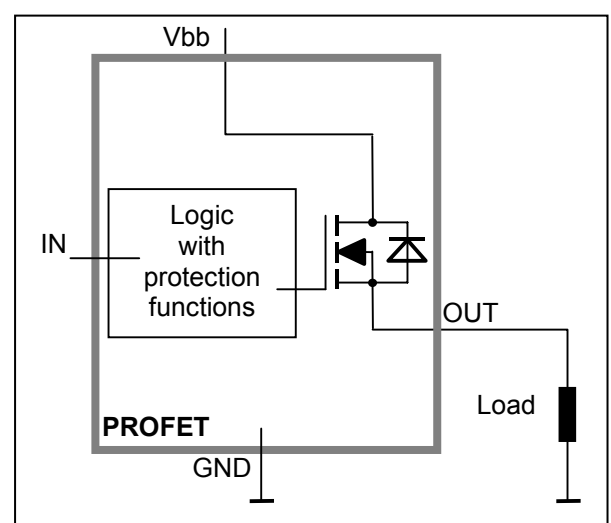

- μC compatible power switch for 5V, 12 V and 24 V DC applications
- All types of resistive, inductive and capacitive loads
- Most suitable for loads with high inrush currents, so as lamps
- Replaces electromechanical relays, fuses and discrete circuits

Basic Functions

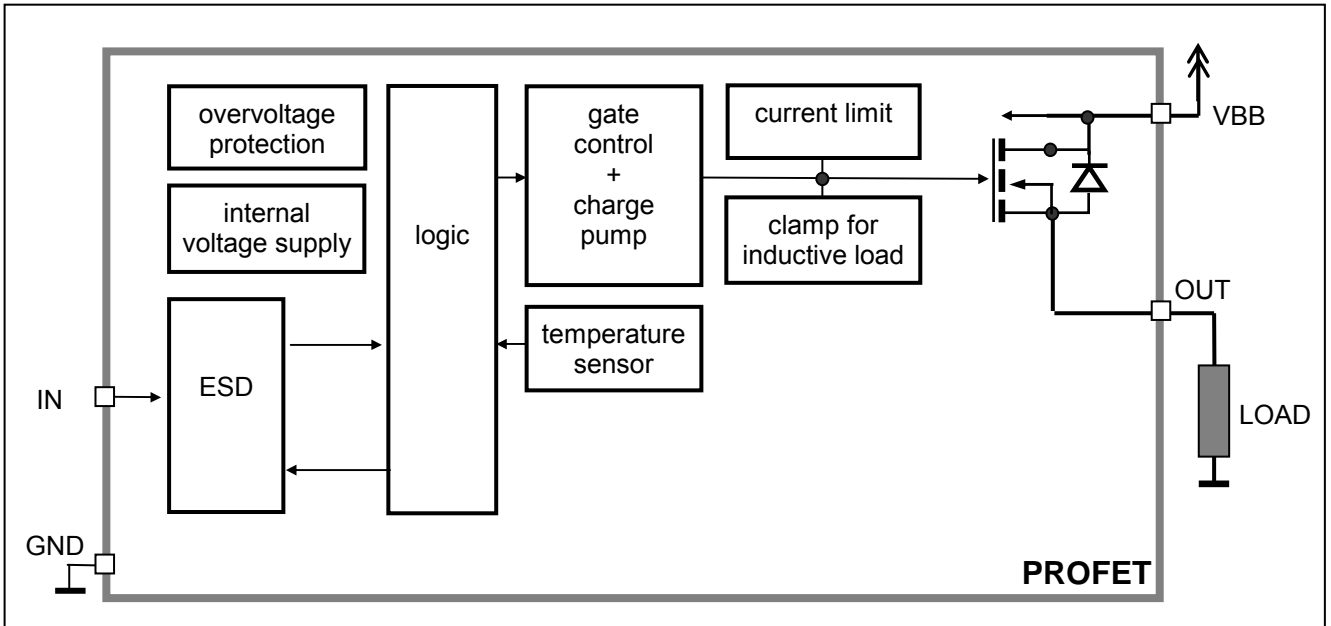

- Very low standby current
- Optimized static electromagnetic compatibility (EMC)
- μC and CMOS compatible
- Fast demagnetization of inductive loads
- Stable behaviour at undervoltage

Protection Functions

- Short circuit protection
- Current limitation
- Overload protection
- Thermal shutdown
- Overvoltage protection (including load dump) with external GND-resistor
- Reverse battery protection with external GND-resistor
- Loss of ground and loss of V_{bb} protection
- Electrostatic discharge (ESD) protection

1) Supply voltages higher than $V_{bb(\text{AZ})}$ require an external current limit for the GND pin, e.g. with a $150\ \Omega$ resistor in the GND connection. A resistor for the protection of the input is integrated.

2) R_1 = internal resistance of the load dump test pulse generator

3) $V_{\text{Load dump}}$ is setup without the DUT connected to the generator per ISO 7637-1 and DIN 40839

4) E_{AS} is the maximum inductive switch off energy

5) Device on $50\text{ mm} \times 50\text{ mm} \times 1.5\text{ mm}$ epoxy PCB FR4 with 6 cm^2 (one layer, $70\ \mu\text{m}$ thick) copper area for V_{bb} connection. PCB is vertical without blown air.

¹⁰⁾ Integrated protection functions are designed to prevent IC destruction under fault conditions described in the data sheet. Fault conditions are considered as "outside" normal operating range. Protection functions are not designed for continuous repetitive operation.

¹¹⁾ not subject to production test, specified by design

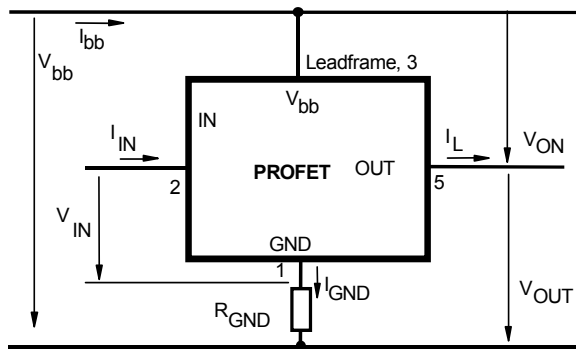

¹²⁾ Device on 50mm*50mm*1.5mm epoxy PCB FR4 with 6cm² (one layer, 70μm thick) copper area for V_{bb} connection. PCB is vertical without blown air.

¹³⁾ Requires 150 Ω resistor in GND connection. The reverse load current through the intrinsic drain-source diode has to be limited by the connected load. Note that the power dissipation is higher compared to normal operating conditions due to the voltage drop across the intrinsic drain-source diode. The temperature protection is not active during reverse current operation! Input and Status currents have to be limited (see max. ratings page 1 and circuit page 7).

Terms

Input circuit (ESD protection)

The use of ESD zener diodes as voltage clamp at DC conditions is not recommended.

Inductive and overvoltage output clamp

V_{ON} clamped to 47 V typ.

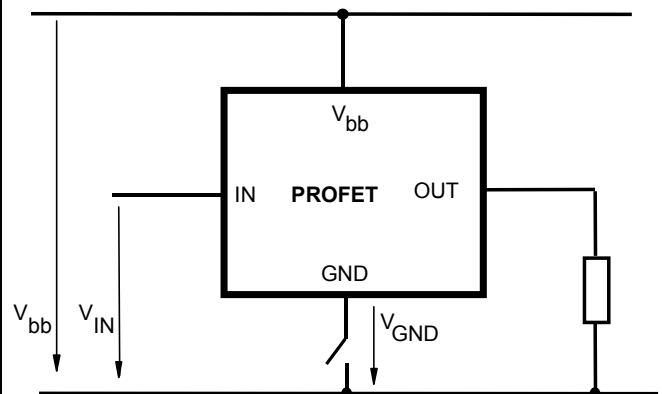

Overvolt. and reverse batt. protection

$V_{Z1} = 6.1 \text{ V typ.}$, $V_{Z2} = 47 \text{ V typ.}$, $R_{GND} = 150 \Omega$, $R_I = 3.5 \text{ k}\Omega \text{ typ.}$

In case of reverse battery the load current has to be limited by the load. Temperature protection is not active

GND disconnect

Any kind of load. In case of Input=high is $V_{OUT} \approx V_{IN} - V_{IN(T+)}$.

GND disconnect with GND pull up

Any kind of load. If $V_{GND} > V_{IN} - V_{IN(T+)}$ device stays off

V_{bb} disconnect with charged inductive load

For inductive load currents up to the limits defined by Z_L (max. ratings and diagram on page 8) each switch is protected against loss of V_{bb} .

Consider at your PCB layout that in the case of V_{bb} disconnection with energized inductive load all the load current flows through the GND connection.

Inductive load switch-off energy dissipation

Energy stored in load inductance:

$$E_L = \frac{1}{2} \cdot L \cdot I_L^2$$

While demagnetizing load inductance, the energy dissipated in PROFET is

$$E_{AS} = E_{bb} + E_L - E_R = \int V_{ON(CL)} \cdot i_L(t) dt,$$

with an approximate solution for $R_L > 0 \Omega$:

$$E_{AS} = \frac{I_L \cdot L}{2 \cdot R_L} (V_{bb} + |V_{OUT(CL)}|) \ln \left(1 + \frac{I_L \cdot R_L}{|V_{OUT(CL)}|} \right)$$

Maximum allowable load inductance for a single switch off

$$L = f(I_L); T_{j,start} = 150^\circ C, V_{bb} = 12 V, R_L = 0 \Omega$$

Typ. on-state resistance

$R_{ON} = f(V_{bb}, T_j); I_L = 2\text{ A}, I_N = \text{high}$

Typ. standby current

$I_{bb(off)} = f(T_j); V_{bb} = 9 \dots 34\text{ V}, I_{N1,2} = \text{low}$
