Package

General Description

- N channel vertical power MOSFET with charge pump, ground referenced CMOS compatible input, diagnostic feedback and proportional load current sense monolithically integrated in Smart SIPMOS® technology.
- Providing embedded protective functions

Applications

- µC compatible high-side power switch with diagnostic feedback for 12V and 24V grounded loads
- All types of resistive, inductive and capacitive loads
- Most suitable for loads with high inrush currents, so as lamps
- Replaces electromechanical relays, fuses and discrete circuits

Basic Functions

- CMOS compatible input
- Undervoltage and overvoltage shutdown with auto-restart and hysteresis
- Fast demagnetization of inductive loads
- Logic ground independent from load ground

Protection Functions

- Short circuit protection
- Overload protection
- Current limitation
- Thermal shutdown
- Overvoltage protection (including load dump) with external resistor
- Reverse battery protection with external resistor
- Loss of ground and loss of V_{bb} protection
- Electrostatic discharge protection (ESD)

Diagnostic Functions

- Proportional load current sense
- Diagnostic feedback with open drain output
- Open load detection in OFF-state with external resistor
- Feedback of thermal shutdown in ON-state

Pin Definitions and Functions

Pin	Symbol	Function
1,10, 11,12,	V_{bb}	Positive power supply voltage. For high current applications the heat slug should be used as V_{bb} connection.
3	IN1	Input 1,2, activates channel 1,2 in case of logic high signal
7	IN2	
16,17, 18,19	OUT1	Output 1,2, protected high-side power output of channel 1,2. All pins of each output have to be connected in parallel for operation according ths spec (e.g. k_{ijis}). Design the wiring for the max. short circuit current
12,13, 14,15	OUT2	
4	ST1	Diagnostic feedback 1,2 of channel 1,2 open drain, invers to input level
8	ST2	
2	GND1	Ground 1,2 of chip channel 1,2
6	GND2	
5	IS1	Sense current output 1,2; proportional to the load current, zero in the case of current limitation of the load current
9	IS2	
Heatslug	V_{bb}	Positiv powersupply voltage. Good way to design a very low thermal resistance.

7) At supply voltage increase up to $V_{bb} = 4.7\text{ V}$ typ without charge pump, $V_{OUT} \approx V_{bb} - 2\text{ V}$

8) Supply voltages higher than $V_{bb(\text{AZ})}$ require an external current limit for the GND and status pins (a $150\ \Omega$ resistor in the GND connection is recommended). See also $V_{ON(\text{CL})}$ in table of protection functions and circuit diagram page 9.

9) Measured with load; for the whole device; all channels off

10) Add I_{ST} , if $I_{ST} > 0$

11) Integrated protection functions are designed to prevent IC destruction under fault conditions described in the data sheet. Fault conditions are considered as "outside" normal operating range. Protection functions are not designed for continuous repetitive operation.

¹²⁾ If channels are connected in parallel, output clamp is usually accomplished by the channel with the lowest $V_{ON(CL)}$

¹³⁾ Requires a $150\ \Omega$ resistor in GND connection. The reverse load current through the intrinsic drain-source diode has to be limited by the connected load. Power dissipation is higher compared to normal operating conditions due to the voltage drop across the drain-source diode. The temperature protection is not active during reverse current operation! Input and Status currents have to be limited (see max. ratings page 3 and circuit page 9).

¹⁴⁾ This range for the current sense ratio refers to all devices. The accuracy of the k_{ILIS} can be raised at least by a factor of two by matching the value of k_{ILIS} for every single device.

In the case of current limitation the sense current I_{IS} is zero and the diagnostic feedback potential V_{ST} is High. See figure 2c, page 12.

Parallel switching of channel 1 and 2 is possible by connecting the inputs and outputs in parallel. The status outputs ST1 and ST2 have to be configured as a 'Wired OR' function with a single pull-up resistor. The current sense outputs IS1 and IS2 have to be connected with a single pull-down resistor.

Terms

Leadframe (V_{bb}) is connected to pin 1,10,11,20
External R_{GND} optional; two resistors R_{GND1} , $R_{GND2} = 150 \Omega$ or a single resistor $R_{GND} = 75 \Omega$ for reverse battery protection up to the max. operating voltage.

- 20) The voltage drop over the power transistor is $V_{bb} - V_{OUT} > 3V$ typ. Under this condition the sense current I_{IS} is zero
- 21) An external short of output to V_{bb} , in the off state, causes an internal current from output to ground. If R_{GND} is used, an offset voltage at the GND and ST pins will occur and the $V_{ST\ low}$ signal may be errorious.
- 22) Low ohmic short to V_{bb} may reduce the output current I_L and therefore also the sense current I_{IS} .
- 23) Power Transistor off, high impedance
- 24) with external resistor between V_{BB} and OUT

Input circuit (ESD protection), IN1 or IN2

The use of ESD zener diodes as voltage clamp at DC conditions is not recommended.

Status output, ST1 or ST2

ESD-Zener diode: 6.1 V typ., max 5.0 mA; $R_{ST(ON)} < 375 \Omega$ at 1.6 mA. The use of ESD zener diodes as voltage clamp at DC conditions is not recommended.

Current sense output, IS1 or IS2

ESD-Zener diode: 6.1 V typ., max 14 mA; $R_{IS} = 1 \text{ k}\Omega$ nominal

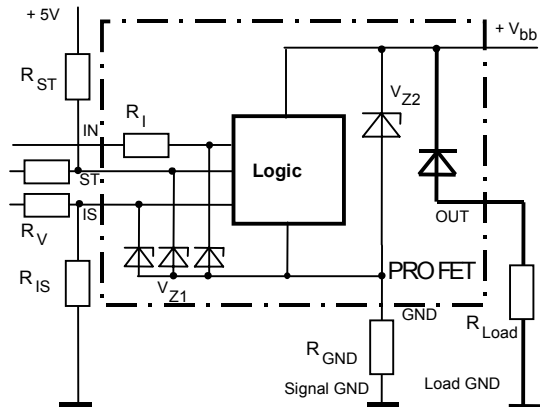

Inductive and overvoltage output clamp, OUT1 or OUT2

V_{ON} clamped to $V_{ON(CL)} = 47 \text{ V typ.}$

Overvoltage and reverse batt. Protection

For each channel

$V_{Z1} = 6.1 \text{ V typ.}$, $V_{Z2} = 47 \text{ V typ.}$, $R_{GND} = 150 \Omega$, $R_{ST} = 15 \text{ k}\Omega$, $R_I = 4.5 \text{ k}\Omega \text{ typ.}$, $R_{IS} = 1 \text{ k}\Omega$, $R_V = 15 \text{ k}\Omega$, In case of reverse battery the current has to be limited by the load. Temperature protection is not active

Open-load detection OUT1 or OUT2

OFF-state diagnostic condition:

$V_{OUT} > 3 \text{ V typ.}$; IN low

GND disconnect, each channel

Any kind of load. In case of IN=high is $V_{OUT} \approx V_{IN} - V_{IN(T+)}$. Due to $V_{GND} > 0$, no $V_{ST} = \text{low}$ signal available.

GND disconnect with GND pull up each channel

Any kind of load. If $V_{GND} > V_{IN} - V_{IN(T+)}$ device stays off. Due to $V_{GND} > 0$, no $V_{ST} = \text{low}$ signal available.

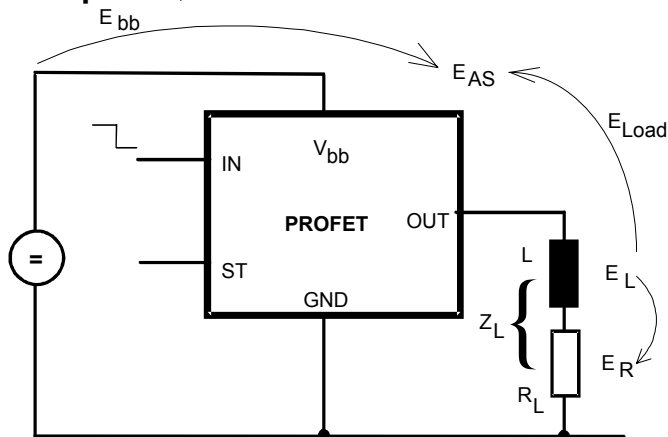

Vbb disconnect with energized inductive load, each channel

For inductive load currents up to the limits defined by Z_L (max. ratings and diagram on page 10) each switch is protected against loss of V_{bb} .

Consider at your PCB layout that in the case of V_{bb} disconnection with energized inductive load all the load current flows through the GND connection.

Inductive load switch-off energy dissipation, each channel

Energy stored in load inductance:

$$E_L = 1/2 \cdot L \cdot I_L^2$$

While demagnetizing load inductance, the energy dissipated in PROFET is

$$E_{AS} = E_{bb} + E_L - E_R = \int V_{ON(CL)} \cdot i_L(t) dt,$$

with an approximate solution for $R_L > 0 \Omega$:

$$E_{AS} = \frac{I_L \cdot L}{2 \cdot R_L} (V_{bb} + |V_{OUT(CL)}|) \ln \left(1 + \frac{I_L \cdot R_L}{|V_{OUT(CL)}|} \right)$$

Maximum allowable load inductance for a single switch off (one channel)⁴⁾

$$L = f(I_L); T_{j,start} = 150^\circ\text{C}, V_{bb} = 12\text{V}, R_L = 0 \Omega$$

Both channels are symmetric and consequently the diagrams are valid for channel 1 and channel 2
