Description

The VN771K is a device formed by three monolithic chips housed in a standard SO-28 package: a double high side and two low side switches. Both the double high side and low side switches are made using STMicroelectronics VIPower™ M0-3 Technology.

This device is suitable to drive a DC motor in a bridge configuration as well as to be used as a quad switch for any low voltage application.

The dual high side switches have built-in thermal shutdown to protect the chips from overtemperature and current limiter blocks to protect the device from short circuit. Status output is provided to indicate open load in off and on state and overtemperature.

The low side switches are two OMNIFET II types (fully autoprotected Power MOSFET in VIPower™ technology). They have built-in thermal shutdown, linear current limitation and overvoltage clamping. Fault feedback for thermal intervention can be detected by monitoring the voltage at the input pin.

4 Application recommendations

Figure 44. Application diagram bridge drivers

Most motor bridge drivers use a reverse battery protection diode (D) inside the supply rail. This diode prevents a reverse current flow back to V_{BATT} in case the bridge becomes disabled via the logic inputs while motor inductance still carries energy. In order to prevent a hazardous overvoltage at circuit supply terminal (V_{CC}), a blocking capacitor (C) is needed to limit the voltage overshoot. As basic orientation, $50\mu\text{F}$ per 1A load current is recommended. As an alternative, a Zener protection (Z) is also suitable.

Even if a reverse polarity diode is not present, it is recommended to use a capacitor or Zener at V_{CC} because a similar problem appears in case the supply terminal of the module has intermittent electrical contact to the battery or gets disconnected while the motor is operating.

Z_{thHS} = High Side Chip Thermal Impedance Junction to Ambient

$Z_{thLS} = Z_{thLS3} = Z_{thLS4}$ = Low Side Chip Thermal Impedance Junction to Ambient

$Z_{thHLSLS} = Z_{thHS12LS3} = Z_{thHS12LS4}$ = Mutual Thermal Impedance Junction to Ambient between High Side and Low Side Chips

$Z_{thLSLS} = Z_{thLS3LS4}$ = Mutual Thermal Impedance Junction to Ambient between Low Side Chips

5.2.4 Pulse calculation formula
