

PCI Hot Plug Controller

The HIP1011A is the second PCI Hot Plug Voltage bus control IC from Intersil. A drop-in alternative to the widely used HIP1011, the HIP1011A has the same form, fit and function but additionally features an adjustable latch-off time of the MOSFET switches and fault reporting.

Like the HIP1011, the HIP1011A creates a small and simple yet complete power control solution with discrete power MOSFETs and a few passive components. Four independent supplies are controlled, +5V, +3.3, +12V, and -12V. The +12V and -12V switches are integrated. For the +5V and +3.3V supplies, overcurrent (OC) protection is provided by sensing the voltage across external current-sense resistors. For the +12V and -12V supplies OC protection is provided internally. In addition, an on-chip reference is used to monitor the +5V, +3.3V and +12V outputs for undervoltage (UV) conditions. The PWRON input controls the state of the switches. During an OC condition on any output, or a UV condition on the +5V, +3.3V or +12V outputs, a LOW (0V) is asserted on the FLTN output and all MOSFETs are latched-off. The time to FLTN signal going LOW and MOSFET latch-off is determined by a single capacitor from the FLTN pin to ground. This added feature allows the system OS to complete housekeeping activities in preparation for an unplanned shut down of the affected card. The FLTN latch is cleared when the PWRON input is toggled low again. During initial power-up of the main VCC supply (+12V), the PWRON input is inhibited from turning on the switches, and the latch is held in the Reset state until the VCC input is greater than 10V.

User programmability of the overcurrent threshold, fault reporting response time, latch-off response time and turn-on slew rate is provided. A resistor connected to the OCSET pin programs the OC threshold. A capacitor may be added to the FLTN pin to adjust both the delay time to reporting a fault and the latch-off of the supplies after an OC or UV event. Capacitors connected to the gate pins set the turn-on rate. In addition the HIP1011A has also been enhanced to tolerate spurious system noise.

Features

- Adjustable Delay Time for Turn-Off and Fault Reporting
- Controls All PCI Supplies: +5V, +3.3V, +12V, -12V
- Internal MOSFET Switches for +12V and -12V Outputs
- μ P Interface for On/Off Control and Fault Reporting
- Adjustable Overcurrent Protection for All Supplies
- Provides Fault Isolation
- Adjustable Turn-On Slew Rate
- Minimum Parts Count Solution
- No Charge Pump
- Pb-Free Available (RoHS Compliant)

Applications

- PCI Hot Plug
- CompactPCI

Ordering Information

| PART NUMBER | TEMP. RANGE (°C) | PACKAGE | PKG. DWG. # |
|------------------------------|------------------|-------------------------|-------------|
| HIP1011ACB | 0 to 70 | 16 Ld SOIC | M16.15 |
| HIP1011ACBZA (See Note) | 0 to 70 | 16 Ld SOIC (Pb-free) | M16.15 |
| HIP1011ACB-T | 0 to 70 | Tape and Reel | |
| HIP1011ACBZA-T (See Note) | 0 to 70 | Tape and Reel (Pb-free) | |

NOTE: Intersil Pb-free products employ special Pb-free material sets; molding compounds/die attach materials and 100% matte tin plate termination finish, which are RoHS compliant and compatible with both SnPb and Pb-free soldering operations. Intersil Pb-free products are MSL classified at Pb-free peak reflow temperatures that meet or exceed the Pb-free requirements of IPC/JEDEC J STD-020C.

Pin Descriptions

| PIN NO. | DESIGNATOR | FUNCTION | DESCRIPTION |
|---------|------------|---------------------------|--|
| 1 | M12VIN | -12V Input | -12V Supply Input. Also provides power to the -12V overcurrent circuitry. |
| 2 | FLT_N | Fault Output | 5V CMOS Fault Output; LOW = FAULT. A capacitor may be placed from this pin to ground to provide delay time to fault notification and power supply latch-off. |
| 3 | 3V5VG | 3.3V/5V Gate Output | Drive the gates of the 3.3V and 5V MOSFETs. Connect a capacitor to ground to set the start-up ramp. During turn on, this capacitor is charged with a 25 μ A current source. |
| 4 | VCC | 12V V _{CC} Input | Connect to unswitched 12V supply. |
| 5 | 12VIN | 12V Input | Switched 12V supply input. |
| 6 | 3VISEN | 3.3V Current Sense | Connect to the load side of the current sense resistor in series with source of external 3.3V MOSFET. |
| 7 | 3VS | 3.3V Source | Connect to source of 3.3V MOSFET. This connection along with pin 6 (3VISEN) senses the voltage drop across the sense resistor. |
| 8 | OCSET | Overcurrent Set | Connect a resistor from this pin to ground to set the overcurrent trip point of all four switches. All four over current trips can be programmed by changing the value of this resistor. The default (6.04k Ω , 1%) is compatible with the maximum allowable currents as outlined in the PCI specification. |
| 9 | PWRON | Power On Control | Controls all four switches. High to turn switches ON, Low to turn them OFF. |
| 10 | 5VS | 5V Source | Connect to source of 5V MOSFET switch. This connection along with pin 11 (5VISEN) senses the voltage drop across the sense resistor. |
| 11 | 5VISEN | 5V Current Sense | Connect to the load side of the current sense resistor in series with source of external 5V MOSFET. |
| 12 | 12VO | Switched 12V Output | Switched 12V output. |
| 13 | GND | Ground | Connect to common of power supplies. |
| 14 | 12VG | Gate of Internal PMOS | Connect a capacitor between 12VG and 12VO to set the start up ramp for the +12V supply. This capacitor is charged with a 25 μ A current source during start-up. The UV circuitry is enabled after the voltage on 12VG is less than 400mV. Therefore, if the capacitor on the pin 3 (3V5VG) is more than 25% larger than the capacitor on pin 14 (12VG) a false UV may be detected during start up. |
| 15 | M12VG | Gate of Internal NMOS | Connect a capacitor between M12VG and M12VO to set the start up ramp for the M12V supply. This capacitor is charged with 25 μ A during start up. |
| 16 | M12VO | Switched -12V Output | Switched 12V Output. |

HIP1011A

Absolute Maximum Ratings

| | |
|-------------------------|---|
| V _{CC} , 12VIN | -0.5V to +14.0V |
| 12VO | -0.5V to V _{12VIN} +0.5V |
| 12VO, 12VG, 3V5VG | -0.5V to V _{CC} +0.5V |
| M12VIN | -15.0V to +0.5V |
| M12VO, M12VG | V _{M12VIN} -0.5V to +0.5V |
| 3VISEN, 5VISEN | -0.5V to the Lesser of V _{CC} or +7.0V |
| Voltage, Any Other Pin | -0.5V to +7.0V |
| 12VO Output Current | .3A |
| M12VO Output Current | 0.8A |
| ESD Classification | .4KeV (HBM) |

Operating Conditions

| | |
|---|------------------|
| V _{CC} Supply Voltage Range | +10.8V to +13.2V |
| ±12V, 5V and 3.3V Input Supply Tolerances | ±10% |
| 12VO Output Current | .0 to +0.5A |
| M12VO Output Current | .0 to +0.1A |
| Temperature Range (T _A) | 0°C to 70°C |

CAUTION: Stresses above those listed in "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress only rating and operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied.

NOTES:

1. θ_{JA} is measured with the component mounted on a low effective thermal conductivity test board in free air. See Tech Brief 379 for details.
2. All voltages are relative to GND, unless otherwise specified.

HIP1011A PCI Hot Plug Controller

Key Feature Description and Operation

A drop-in alternative to the widely used HIP1011, the HIP1011A additionally features an adjustable delay time to fault reporting and latch-off of the MOSFET switches. During an over current condition (OC) on any output, or an under voltage (UV) condition on the +5V, +3.3V or +12V outputs, a LOW (0V) is presented on the FLTN output and all MOSFETs are latched-off. A programmable delay time from an OC or UV event to the FLTN signal going LOW and MOSFET latch-off can be designed into the system by a single capacitor from the FLTN pin to ground. The addition of an increasingly larger capacitor value on the FLTN pin increases the time from the OC or UV occurrence to the start of the FLTN high to low transition. The capacitor also slows the falling ramp thus delaying reaching the FLTN latch threshold of ~2.4V. Once the FLTN latch voltage threshold is reached the HIP1011A then simultaneously shuts down all four supplies. This added feature enables the HIP1011A to ignore both transient UV and OC events to the extent of a single capacitor value in the system design. This feature also may allow the system OS to complete housekeeping activities in preparation for a possible unplanned shutdown of the affected card by receiving an early warning signal from the HIP1011A.

Customizing and Optimizing Circuit Performance and Functionality

HOW ADJUSTABLE IS THE FAULT REPORTING DELAY AND TIME TO POWER SUPPLY LATCH-OFF?

Figure 12 illustrates the relationship between the FLTN signal and the gate drive outputs. Duration **a**, indicates the time between FLTN starting to transition from High to Low,

(indicating a fault has occurred) and the start of the gate drive outputs latching off. The latch-off is initiated by the falling FLTN signal reaching the output latch threshold voltage, $V_{FLTN, TH}$. Table 1 illustrates the effect of the FLTN capacitor on the response time.

TABLE 1. RESPONSE TIME TABLE

| | 0.001 μ F | 0.1 μ F | 10 μ F |
|-------------------------|---------------|-------------|------------|
| 3V5VG Response a | 0.85 μ s | 37 μ s | 3.8ms |

FIGURE 12. TIMING DIAGRAM

CAN THE HIP1011A BE USED ON A CompactPCI BOARD?

Yes, the HIP1011A can be used on a CompactPCI card application. See Technical Brief TB358.

NOTE:

- 3. All capacitors are $\pm 10\%$.

FIGURE 11. HIP1011A TYPICAL APPLICATION

ARE THERE PCB LAYOUT DESIGN BEST PRACTICES TO FOLLOW? WHAT ARE THEY?

As with most innovative ICs performing critical tasks there are crucial PCB layout best practices to follow for optimal performance. PCB traces that connect each end of the current sense resistors to the HIP1011A must not carry any load current. This can be accomplished by two dedicated PCB traces directly from the sense resistor to the HIP1011A, see examples of correct and incorrect layouts in Figure 13.

FIGURE 13. SENSE RESISTOR LAYOUT

Typical Applications: HIP1011A PCI Hot Plug Controller

Introduction to HIP1011A and PCI Hot Plug Evaluation Board

The HIP1011A is compatible with the PCI Hot Plug specification as it is derived from the widely used HIP1011. This device facilitates “HOT PLUGGING”, the removal or insertion of PCI compliant cards without the need to power down the server voltage bus. The HIP1011A controls all four, -12V, +12V, +3.3V, +5V supplies found in PCI applications, monitoring and protecting all against over current (OC) and the +12V, +3.3V, +5V for under voltage (UV) conditions. Reference the PCI Hot Plug specification available from www.pcisig.com.

Figure 14 illustrates the PCB pattern for implementation of the HIP1011A with 4 power MOSFETs. Additional components for optimizing performance in particular applications, ambient electrical noise levels or desired features will be necessary. The ease of implementation of the HIP1011A and MOSFETs is complemented by the small PCB foot print necessary, since both are available in 0.150

inch SOICs. The typical application requires only 1.1 square inches of PCB board space.

FIGURE 14. LAYOUT PLOT, ACTUAL SIZE (0.75in x 1.5in)

IS THERE A HIP1011A PCI HOT PLUG EVALUATION BOARD AVAILABLE?

There is an evaluation board available through your local Intersil sales office. The HIP1011AEVAL1 board (Figure 15) is a simple board designed to demonstrate and evaluate the HIP1011A using an external PWRON signal simulating a PCI Hot Plug environment. The HIP1011AEVAL1 board comes in 2 parts, the mother board with the HIP1011A, MOSFETs with external components and a load board simulating a ‘typical’ PCI load with adequate space for modifying the existing load or to add an electronic load. Even with a number of available test points the HIP1011A implementation space is still very efficient. In addition, the demo board offers adequate space to evaluate the application note discussions found in AN9737.

NOTES:

1. Symbols are defined in the "MO Series Symbol List" in Section 2.2 of Publication Number 95.
2. Dimensioning and tolerancing per ANSI Y14.5M-1982.
3. Dimension "D" does not include mold flash, protrusions or gate burrs. Mold flash, protrusion and gate burrs shall not exceed 0.15mm (0.006 inch) per side.
4. Dimension "E" does not include interlead flash or protrusions. Interlead flash and protrusions shall not exceed 0.25mm (0.010 inch) per side.
5. The chamfer on the body is optional. If it is not present, a visual index feature must be located within the crosshatched area.
6. "L" is the length of terminal for soldering to a substrate.
7. "N" is the number of terminal positions.
8. Terminal numbers are shown for reference only.
9. The lead width "B", as measured 0.36mm (0.014 inch) or greater above the seating plane, shall not exceed a maximum value of 0.61mm (0.024 inch)
10. Controlling dimension: MILLIMETER. Converted inch dimensions are not necessarily exact.

All Intersil U.S. products are manufactured, assembled and tested utilizing ISO9000 quality systems. Intersil Corporation's quality certifications can be viewed at www.intersil.com/design/quality

Intersil products are sold by description only. Intersil Corporation reserves the right to make changes in circuit design, software and/or specifications at any time without notice.
