

DisplayPort 1:2 Switch With Integrated TMDS Translator

FEATURES

- One Input Port to One of Two Output Ports
- Integrated TMDS Level Translator with Receiver Equalization
- DP Port Supports Data Rates up to 2.7 Gbps
- DP Port Supports Dual-Mode DisplayPort
- DP Port Output Waveform Mimics Input Waveform Characteristics
- TMDS Port Supports Data Rates up to 2.5 Gbps
- Integrated I²C Logic Block for DVI/HDMI Connector Recognition
- Enhanced ESD:
 - 12 kV on all High Speed Pins
 - 8 kV on all Auxiliary and I²C Pins
- Enhanced Commercial Temperature Range: 0°C to 85°C
- 56 Pin 8 × 8 QFN Package

APPLICATIONS

- Personal Computer Market
 - Desktop PC
 - Notebook PC
 - Docking Station
 - Standalone Video Card

DESCRIPTION

The SN75DP122 is a one Dual-Mode DisplayPort input to one Dual-Mode DisplayPort output or one TMDS output. The TMDS output has a built in level translator compliant with Digital Video Interface (DVI) 1.0 and High Definition Multimedia Interface (HDMI) 1.3b. The DisplayPort output follows the input signal in a manner that provides the highest level of signal integrity while supporting the EMI benefits of spread spectrum clocking. Through the SN75DP122 data rates of up to 2.7 Gbps through each link for a total throughput of up to 10.8 Gbps can be realized.

In addition to the switching of the DisplayPort high speed signal lines, the SN75DP122 also supports the switching of the bidirectional auxiliary (AUX), Hot Plug Detect (HPD), and Cable Adapter Detect (CAD) channels. The Auxiliary differential pair supports Dual-Mode DisplayPort operation through the DisplayPort port. Through the TMDS port the auxiliary port is configured as an I²C port with an integrated I²C repeater.

The SN75DP122 is characterized for operation over ambient air temperature of 0°C to 85°C.

TYPICAL APPLICATION

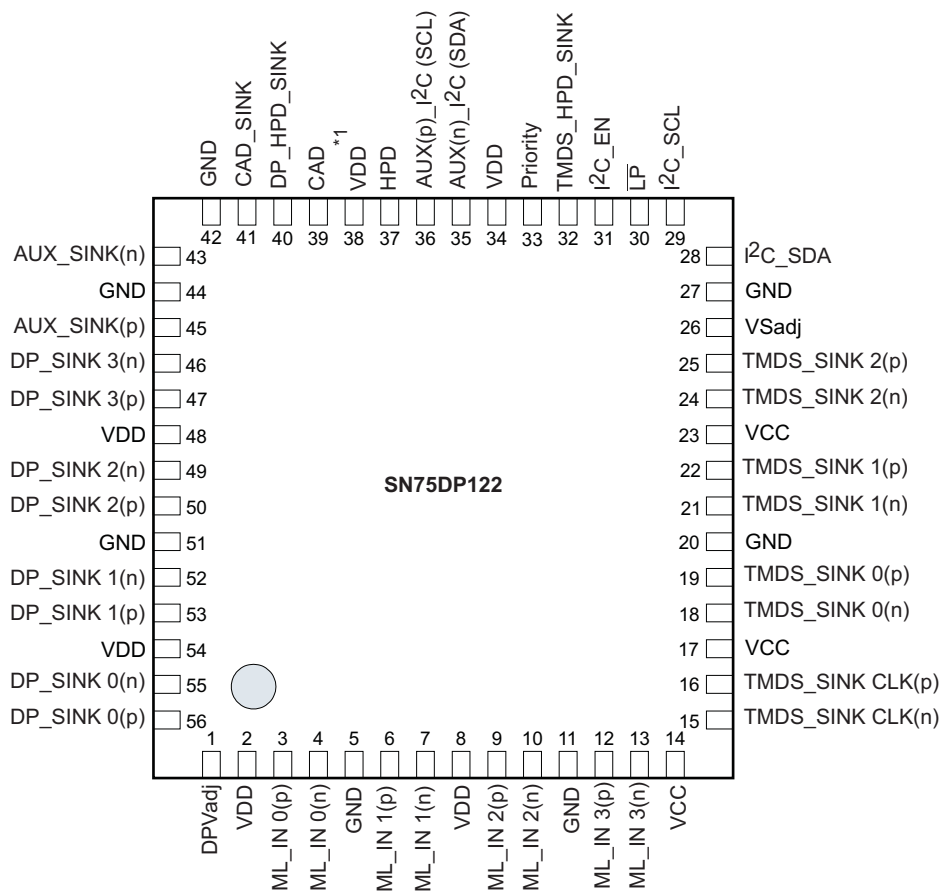

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

DATA FLOW BLOCK DIAGRAM

TERMINAL FUNCTIONS

TERMINAL		I/O	DESCRIPTION
NAME	NO.		
MAIN LINK INPUT PINS			
ML_IN 0	3, 4	I	DisplayPort main link channel 0 differential input
ML_IN 1	6, 7	I	DisplayPort main link channel 1 differential input
ML_IN 2	9, 10	I	DisplayPort main link channel 2 differential input
ML_IN 3	12, 13	I	DisplayPort main link channel 3 differential input
MAIN LINK PORT A OUTPUT PINS			
DP_SINK 0	56, 55	O	DisplayPort main link port a channel 0 differential output
DP_SINK 1	53, 52	O	DisplayPort main link port a channel 1 differential output
DP_SINK 2	50, 49	O	DisplayPort main link port a channel 2 differential output
DP_SINK 3	47, 46	O	DisplayPort main link port a channel 3 differential output
MAIN LINK PORT B OUTPUT PINS			
TMDS_SINK 2	25, 24	O	TMDS data 2 differential output
TMDS_SINK 1	22, 21	O	TMDS data 1 differential output
TMDS_SINK 0	19, 18	O	TMDS data 0 differential output
TMDS_SINK CLK	16, 15	O	TMDS data clock differential output
HOT PLUG DETECT PINS			
HPD	37	O	Hot plug detect output to the displayport source
DP_HPDI_SINK	40	I	DisplayPort port hot plug detect input
TMDS_HPDI_SINK	32	I	TMDS port hot plug detect input
AUXILIARY DATA PINS			
AUX_I ² C	36, 35	I/O	Source side bidirectional displayport auxiliary data line
AUX_SINK	45, 43	I/O	DisplayPort port bidirectional displayport auxiliary data line
I ² C_SCL I ² C_SDA	29, 28	I/O	TMDS port bidirectional ddc data lines
CABLE ADAPTER DETECT PINS			
CAD	39	O	Cable adapter detect output to the displayport source
CAD_SINK	41	I	DisplayPort cable adapter detect input
CONTROL PINS			
$\overline{\text{LP}}$	30	I	Low power select bar
Priority	33	I	Output port priority selection
DPVadj	1	I	DisplayPort main link output gain adjustment
VSadj	26	I	TMDS compliant voltage swing control
I ² C_EN	31	I	Internal I ² C register enable, used for HDMI / DVI connector differentiation
SUPPLY and GROUND PINS			
VDD	2, 8, 34, 48, 54		5-V supply
VDD ^{*1}	38		HPD/CAD supply
VCC	14, 17, 23		3.3-V supply
GND	5, 11, 20, 27, 42, 44, 51		Ground

Table 1. Control Pin Lookup Table

SIGNAL	LEVEL ⁽¹⁾	STATE	DESCRIPTION
$\overline{\text{LP}}$	H	Normal Mode	Normal operational mode for device
	L	Low Power Mode	Device is forced into a low power state causing the outputs to go to a high impedance state. All other inputs are ignored
Priority	H	TMDS Port has Priority	If both DP_HPD_SINK and TMDS_HPD_SINK are high, the TMDS port is selected
	L	DP Port has Priority	If both DP_HPD_SINK and TMDS_HPD_SINK are high, the DP port is selected
I ² C_EN	H	HDMI	The Internal I ² C register is active and readable when the TMDS port is selected indicating that the connector being used is HDMI
	L	DVI	The Internal I ² C register is disabled and not readable when the TMDS port is selected indicating that the connector being used is DVI
DP _{vadj}	4.53 kΩ	Increased Gain	Main link displayport output has an increased voltage swing
	6.49 kΩ	Nominal Gain	Main link displayport output has a nominal voltage swing
	10 kΩ	Decreased Gain	Main link displayport output has a decreased voltage swing
VS _{adj}	5.11 kΩ	Compliant Voltage Swing	Driver output voltage swing precision control to aid with system compliance

Explanation of the internal switching logic of the SN75DP122 is located in the application section at the end of this data sheet.

ORDERING INFORMATION⁽¹⁾

PART NUMBER	PART MARKING	PACKAGE
SN75DP122RTQR	75DP122	56-pin QFN Reel (large)
SN75DP122RTQT	75DP122	56-pin QFN Reel (small)

(1) For the most current package and ordering information, see the Package Option Addendum at the end of this document, or see the TI web site at www.ti.com.

ABSOLUTE MAXIMUM RATINGS

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

		VALUE	UNIT	
Supply voltage range ⁽²⁾	V _{DD} , V _{DD} ^{*1}	-0.3 to 5.25	V	
Supply voltage range	V _{CC}	-0.3 to 3.6	V	
Voltage range	Main Link I/O (ML_IN x, DP_SINK x) Differential Voltage	1.5	V	
	TMDS I/O	-0.3 to 4	V	
	HPD and CAD I/O	-0.3 to 5.25	V	
	Auxiliary I/O	-0.3 to 5.25	V	
	Control I/O	-0.3 to 5.25	V	
Electrostatic discharge	Human body model ⁽³⁾	Auxiliary and I ² C I/O	±8000	V
		All other pins	±12000	
	Charged-device model ⁽³⁾	±1000	V	
	Machine model ⁽⁴⁾	±200	V	
Continuous power dissipation		See Dissipation Rating Table		

(1) Stresses beyond those listed under absolute maximum ratings may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any conditions beyond those indicated under recommended operating conditions is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

(2) All voltage values, except differential voltages, are with respect to network ground terminal.

(3) Tested in accordance with JEDEC Standard 22, Test Method A114-B

(4) Tested in accordance with JEDEC Standard 22, Test Method A115-A

DISSIPATION RATINGS

PACKAGE	PCB JEDEC STANDARD	$T_A < 25^\circ\text{C}$	DERATING FACTOR ⁽¹⁾ ABOVE $T_A = 25^\circ\text{C}$	$T_A = 85^\circ\text{C}$ POWER RATING
56-Pin QFN (RTQ)	Low-K	3623 mW	36.23 mW/°C	1449 mW
	High-K	1109 mW	11.03 mW/°C	443.9 mW

(1) This is the inverse of the junction-to-ambient thermal resistance when board-mounted and with no air flow.

THERMAL CHARACTERISTICS

over operating free-air temperature range (unless otherwise noted)

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX ⁽¹⁾	UNIT
$R_{\theta\text{JB}}$ Junction-to-board thermal resistance	4x4 Thermal vias under powerpad		11.03		°C/W
$R_{\theta\text{JC}}$ Junction-to-case thermal resistance			20.4		C/W

TMD5 DIFFERENTIAL OUTPUT PINS				
AV_{CC} TMD5 output termination voltage	3	3.3	3.6	V
d_{R} Data rate			2.5	Gbps
R_{t} Termination resistance	45	50	55	Ω
AUXILIARY AND I²C PINS				
V_{I} Input voltage	0		5.25	V
$d_{\text{R(AUX)}}$ Auxiliary data rate			1	MHz
$d_{\text{R(I2C)}}$ I ² C data rate			100	kHz
HPD, CAD, AND CONTROL PINS				
V_{IH} High-level input voltage	2		5.25	V
V_{IL} Low-level input voltage	0		0.8	V

DEVICE POWER

The SN75DP122 is designed to operate off of two supply voltages. The DisplayPort port and the digital logic run off of the 5V supply voltage. The TMDS level translator is powered off of the 3.3V supply.

ELECTRICAL CHARACTERISTICS

over recommended operating conditions (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
I_{DD}	Supply current	LP = 5 V, $V_{DD}^{*1} = V_{DD}$, Priority = 0 V ML: $V_{ID} = 600$ mV, 2.7 Gbps PRBS AUX: $V_{ID} = 500$ mV, 1 Mbps PRBS DP/TMDS_HPD_SINK and CAD_SINK = 5 V		60	65	mA
I_{CC}				0.1	0.25	
$I_{DD(2)}$	Supply current	LP = 5 V, $V_{DD}^{*1} = V_{DD}$, Priority = 1 V ML: $V_{ID} = 500$ mV, 2.5 Gbps PRBS AUX: $V_I = 2$ V, 100 kHz DP/TMDS_HPD_SINK and CAD_SINK = 5 V		2	4	mA
$I_{CC(2)}$				80	110	
I_{DD}^{*1}	Supply current	$V_{DD}^{*1} = 5.25$ V		0.1	4	mA
I_{SD}	Shutdown current	$\overline{LP} = 0$ V		1	16	μ A

HOT PLUG AND CABLE ADAPTER DETECT

The SN75DP122 is designed to support the switching of the Hot Plug Detect and Cable adapter Detect signals. The SN75DP122 has a built in level shifter for the HPD and CAD outputs. The output voltage level of the HPD and CAD pins is defined by the voltage level of the V_{DD}^{*1} pin.

When the DisplayPort port is selected, the state of CAD_SINK is propagated to the CAD output pin. If the TMDS port is selected, the CAD output pin stays HIGH as long as that port is selected.

Explanation of HPD and the internal logic of the SN75DP122 is located in the application section at the end of the data sheet.

ELECTRICAL CHARACTERISTICS

over recommended operating conditions (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
V_{OH5}	High-level output voltage	$I_{OH} = -100$ μ A, $V_{DD}^{*1} = 5$ V	4.5		5	V

DisplayPort Auxiliary Pins

The SN75DP122 is designed to support the bidirectional auxiliary signals through the DisplayPort port in both a differential (DisplayPort) mode and an I²C (DVI, HDMI) mode. The performance of the Auxiliary bus is optimized based on the status of the CAD_SINK pin.

DisplayPort Link Pins

The SN75DP122 is designed to support DisplayPort's high speed differential main link through the DisplayPort port. The main link I/O of the SN75DP122 are designed to track the magnitude and frequency characteristics of the input waveform and replicate them on the output. A feature has also been incorporated in the SN75DP122 to increase the either increase of decrease the output amplitude via the resistor connected between the DPVADJ pin and ground.

TMDS I²C Pins

When the TMDS port is selected the SN75DP122 utilizes an I²C repeater. The repeater is designed to isolate the parasitic effects of the system in order to aid with system level compliance.

In addition to the I²C repeater, the SN75DP122 also supports the connector detection I²C register. This register is enabled via the I²C_EN pin. When active an internal memory register is readable via the AUX_I²C I/O. The functionality of this register block is described in the application section

TMDS MAIN LINK PINS

The TMDS port of the SN75DP122 is designed to be compliant with the Digital Video Interface (DVI) 1.0 and High Definition Multimedia Interface (HDMI) 1.3 specifications. The differential output voltage swing can be fine tuned with the VSadj resistor.

ELECTRICAL CHARACTERISTICS

APPLICATION INFORMATION

SWITCHING LOGIC

The Switching logic of the SN75DP122 is tied to the state of the HPD pins as well as the LP and priority pins. When both HPD_A and HPD_B input pins are LOW, the SN75DP122 enters the low power state. In this state the outputs are high impedance. When either HPD_A or HPD_B goes high, the device enters the normal operational state and the port associated with the HPD pin that went high is selected. If both HPD_A and HPD_B are HIGH, the port selection is determined by the state of the priority pin.

In order to ease the transitioning from one output port to the other output port the SN75DP122 forces the HPD output pin LOW for an extended duration. This forced Low is designed to mimic an unplug event for the transmitting device. This should allow for a smooth transition from one port to another. This forced LOW timer can be bypassed by pulsing the LP pin LOW for a short duration and then returning to HIGH. When the LP pin is driven LOW the device enters a low power state and the internal logic block is reset.

I²C INTERFACE NOTES

The I²C interface can be used to access the internal memory of the SN75DP122. I²C is a two-wire serial interface developed by Philips Semiconductor (see I²C-Bus Specification, Version 2.1, January 2000). The bus consists of a data line (SDA) and a clock line (SCL) with pull-up structures. When the bus is *idle*, both SDA and SCL lines are pulled high. All the I²C compatible devices connect to the I²C bus through open drain I/O pins, SDA and SCL. A *master* device, usually a microcontroller or a digital signal processor, controls the bus. The master is responsible for generating the SCL signal and device addresses. The master also generates specific conditions that indicate the START and STOP of data transfer. A *slave* device receives and/or transmits data on the bus under control of the master device. The SN75DP122 works as a slave and supports the standard mode transfer (100 kbps) and fast mode transfer (400 kbps) as defined in the I²C-Bus Specification.

The basic I²C start and stop access cycles are shown in [Figure 31](#).

The basic access cycle consists of the following:

- A start condition
- A slave address cycle
- Any number of data cycles
- A stop condition

Figure 31. I²C Start and Stop Conditions

GENERAL I²C PROTOCOL

- The *master* initiates data transfer by generating a *start condition*. The *start condition* is when a high-to-low transition occurs on the SDA line while SCL is high, as shown in [Figure 31](#). All I²C-compatible devices should recognize a *start condition*.
- The master then generates the SCL pulses and transmits the 7-bit address and the *read/write direction bit* R/W on the SDA line. During all transmissions, the master ensures that data is *valid*. A *valid data* condition requires the SDA line to be stable during the entire high period of the clock pulse (see [Figure 32](#)). All devices recognize the address sent by the master and compare it to their internal fixed addresses. Only the slave device with a matching address generates an *acknowledge* (see [Figure 33](#)) by pulling the SDA line low during the entire high period of the ninth SCL cycle. On detecting this acknowledge, the master knows that a

communication link with a slave has been established.

- The master generates further SCL cycles to either *transmit* data to the slave (R/W bit 0) or *receive* data from the slave (R/W bit 1). In either case, the *receiver* needs to acknowledge the data sent by the *transmitter*. So an acknowledge signal can either be generated by the master or by the slave, depending on which one is the receiver. The 9-bit valid data sequences consisting of 8-bit data and 1-bit acknowledge can continue as long as necessary (see Figure 34).
- To signal the end of the data transfer, the master generates a *stop condition* by pulling the SDA line from low to high while the SCL line is high (see Figure 31). This releases the bus and stops the communication link with the addressed slave. All I²C compatible devices must recognize the *stop condition*. Upon the receipt of a stop condition, all devices know that the bus is released, and they wait for a *start condition* followed by a matching address.

Figure 32. I²C Bit Transfer

Figure 33. I²C Acknowledge

Figure 34. I²C Address and Data Cycles

During a read cycle, the slave receiver acknowledges the initial address byte if it decodes the address as its

address. Following this initial acknowledge by the slave, the master device becomes a receiver and acknowledges data bytes sent by the slave. When the master has received all of the requested data bytes from the slave, the not acknowledge (A) condition is initiated by the master by keeping the SDA signal high just before it asserts the stop (P) condition. This sequence terminates a read cycle as shown in Figure 35 and Figure 36. See Example – Reading from the SN75DP122 section for more information.

Figure 35. I²C Read Cycle

Figure 36. Multiple Byte Read Transfer

Slave Address

Both SDA and SCL must be connected to a positive supply voltage via a pull-up resistor. These resistors should comply with the I²C specification that ranges from 2 kΩ to 19 kΩ. When the bus is free, both lines are high. The address byte is the first byte received following the START condition from the master device. The 7-bit address is factory preset to 1000000. Table 2 lists the calls that the SN75DP122 responds to.

Table 2. SN75DP122 Slave Address

FIXED ADDRESS							READ/WRITE BIT
Bit 7 (MSB)	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0 (R/W)
1	0	0	0	0	0	0	1

Sink Port Selection Register and Source Plug-In Status Register Description (Sub-Address)

The SN75DP122 operates using a multiple byte transfer protocol similar to Figure 36. The internal memory of the SN75DP122 contains the phrase DP-HDMI ADAPTOR<EOT> converted to ASCII characters. The internal memory address registers and the value of each can be found in Table 3.

During a read cycle, the SN75DP122 sends the data in its selected sub-address in a single transfer to the master device requesting the information. See the Example – Reading from the SN75DP122 section of this document for the proper procedure on reading from the SN75DP122.

Table 3. SN75DP122 Sink Port and Source Plug-In Status Registers Selection

Address	0x00	0x01	0x02	0x03	0x04	0x05	0x06	0x07	0x08	0x09	0x0A	0x0B	0x0C	0x0D	0x0E	0x0F	0x10
Data	44	50	2D	48	44	4D	49	20	41	44	41	50	54	4F	52	04	FF

EXAMPLE – READING FROM THE SN75DP122

The read operation consists of several steps. The I²C master begins the communication with the transmission of the start sequence followed by the slave address of the SN75DP122. The SN75DP122 acknowledges its presence to the master and begin to transmit the contents of the memory registers. After each byte is transferred the SN75DP122 waits for either an acknowledge (ACK) or a not-acknowledge (NACK) from the master. If an ACK is received, the next byte of data is transmitted. If a NACK is received the data transmission sequence is expected to end and the master should send the stop command.

The SN75DP122 continues to send data as long as the master continues to acknowledge each byte transmission. If an ACK is received after the transmission of byte 0x0F, the SN75DP122 transmits byte 0x10 and continue to transmit byte 0x10 for all further ACK's until a NACK is received.

SN75DP122 Read Phase:

Step 1	0								
I ² C Start (Master)	S								
Step 2	7	6	5	4	3	2	1	0	
I ² C General Address (Master)	1	0	0	0	0	0	0	1	
Step 3	9								
I ² C Acknowledge (Slave)	A								
Step 10	7	6	5	4	3	2	1	0	
I ² C Read Data (Slave)	Data	Data	Data	Data	Data	Data	Data	Data	

Where Data is determined by the logic values contained in the Sink port register

Step 11	9
I ² C Not-Acknowledge (Master)	X

Where X is either an A (Acknowledge) or \bar{A} (Not-Acknowledge)

An A causes the pointer to increment and step 10 is repeated

An \bar{A} causes the slave to stop transmitting and proceed to step 12

Step 12	0
I ² C Stop (Master)	P

SWITCHING LOGIC

The switching logic of the SN75DP122 is tied to the state of the HPD input pins as well as the priority pin and low power pin. When both HPD_A and HPD_B input pins are LOW, the SN75DP122 enters the low power state. In this state the outputs are high impedance, and the device is shutdown to optimize power conservation. When either HPD_A or HPD_B goes high, the device enters the normal operational state, and the port associated with the HPD pin that went high is selected. If both HPD_A and HPD_B are HIGH, the port selection is determined by the state of the priority pin.

Several key factors were taken into consideration with this digital logic implementation of channel selection as well as HPD repeating. This logic has been divided into the following four scenarios.

1. Low power state to active state. There are two possible cases for this scenario depending on the state of the low power pin:
 - Case one: In this case both HPD inputs are initially LOW and the low power pin is also LOW. In this initial state the device is in a low power mode. Once one of the HPD inputs goes to a HIGH state, the device remains in the low power mode with both the main link and auxiliary I/O in a high impedance state. However, the port associated with the HPD input that went HIGH is still selected and the HPD output to the source is enabled and follows the logic state of the input HPD (see [Figure 37](#)). The state of the Priority pin has no effect in this scenario as only one HPD input port is active.

Figure 37.

- Case two: In this case both HPD inputs are initially LOW and the low power pin is HIGH. In this initial state the device is in a low power mode. Once one of the HPD inputs goes to a HIGH state, the device comes out of the low power mode and enters active mode enabling the main link and auxiliary I/O. The port associated with the HPD input that went HIGH is selected and the HPD output to the source is enabled and follows the logic state of the input HPD (see Figure 38). This is specified as $t_{Z(HPD)}$. Again, the state of the Priority pin has no effect in this scenario as only one HPD input port is active.

Figure 38.

2. HPD Changes on the selected port. There are also two possible starting cases for this scenario:
 - Case one: In this case only one HPD input is initially HIGH. The HPD output logic state follows the state of the HPD input. If the HPD input pulses LOW, as may be the case if the Sink device is requesting an interrupt, the HPD output to the source also pulses LOW for the same duration of time with a slight delay

(see Figure 39). The delay of this signal through the SN75DP122 is specified as $t_{PD(HPD)}$. If the duration of the LOW pulse is less than $t_{M(HPD)}$, it may not be accurately repeated to the source. If the duration of the LOW pulse exceeds $t_{T2(HPD)}$, the device assumes that an unplug event has occurred and enters the low power state (see Figure 40). Once the HPD input goes high again, the device returns to the active state as indicated in scenario 1. The state of the Priority pin has no effect in this scenario as only one HPD input port is active.

Figure 39.

Figure 40.

- Case two: In this case both HPD inputs are initially HIGH and the selected port has been determined by the state of the priority pin. The HPD output logic state follows the state of the selected HPD input. If the HPD input pulses LOW, the HPD output to the source also pulses LOW for the same duration of time, again with a slight delay (see Figure 41). If the duration of the LOW pulse exceeds $t_{T2(HPD)}$, the device assumes that an unplug event has occurred and the other port is selected (see Figure 42). The case in

which the previously selected port with priority goes high again is covered in scenario 3.

Figure 41.

Figure 42.

3. One channel becomes active while other channel is already selected. There are also two possible starting cases for this scenario:

- Case one: In this case the HPD input that is initially HIGH is from the port that has priority. Since the port with priority is already selected, any activity on the HPD input from the other port does not have any effect on the switch whatsoever (see Figure 43).

Figure 43.

- Case two: In this case the HPD input that is initially HIGH is not the port with priority. When the HPD input of the port that has priority goes high, the HPD output is forced LOW for some time in order to simulate an unplug event to the source device. The duration of this LOW output is defined as $t_{T2(HPD)}$. If the HPD input of the port with priority pulses LOW for a short duration while the $t_{T2(HPD)}$ timer is counting down, the timer is reset. Once this time has passed the switch switches to the port with priority and the output HPD once again follows the state of the newly selected channel's HPD input (see Figure 44).

Figure 44.

4. Priority pin is toggled. There are also two possible starting cases for this scenario:
 - Case one: In this case only one HPD input is HIGH. A port whose HPD input is LOW cannot be selected. In this case, the state of the priority pin has no effect on the switch (see Figure 45).

Figure 45.

- Case two: In this case both HPD inputs are HIGH. Changing the state of the priority pin when both HPD inputs are high forces the device to switch which channel is selected. When a state change is detected on the priority pin, the device waits for a short period of time $t_{T1(HPD)}$ before responding (see Figure 46). The purpose for this pause is to allow for the priority signal to settle and also to allow the device to ignore potential glitches on the priority pin. Once $t_{T1(HPD)}$ has expired, the HPD output is forced LOW for $t_{T2(HPD)}$ and the device follows the chain of events outlined in scenario 3 case 2.

⁽¹⁾ The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

⁽²⁾ Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

⁽³⁾ MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

PLASTIC QUAD FLATPACK

- NOTES:
- All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5-1994.
 - This drawing is subject to change without notice.
 - QFN (Quad Flatpack No-Lead) Package configuration.
 - The package thermal pad must be soldered to the board for thermal and mechanical performance. See the Product Data Sheet for details regarding the exposed thermal pad dimensions.
 - Package complies to JEDEC MO-220.

THERMAL INFORMATION

This package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB). After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For information on the Quad Flatpack No-Lead (QFN) package and its advantages, refer to Application Report, Quad Flatpack No-Lead Logic Packages, Texas Instruments Literature No. SCBA017. This document is available at www.ti.com.

The exposed thermal pad dimensions for this package are shown in the following illustration.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
