

CMOS White LED Driver

FEATURES

- Low quiescent ground current (0.5mA typical)
- Power efficiency over 80%
- Compatible pinout with LT1932
- Adjustable output current (up to 40mA)
- High frequency 1.2MHz operation
- Input voltage operation down to 2.0V
- Low resistance (0.5Ω) high voltage power switch
- Drives up to 4 White LEDs in series
- Shutdown current less than 1μA
- Load fault protection against open-circuits
- Low value external components
- Low profile (1mm) TSOT-23 6-lead and TDFN 8-pad (0.8mm) package

APPLICATION

- Color LCD and keypad backlighting
- Cellular phones
- Handheld terminals
- Digital cameras
- PDAs/Games
- Portable MP3 players

For Ordering Information details, see page 13.

DESCRIPTION

The CAT32 is a DC/DC step up converter that delivers a regulated output current. Operation at a constant switching frequency of 1.2MHz allows the device to be used with very small value external inductor and ceramic capacitors.

The CAT32 is targeted to drive multiple white light-emitting diodes (LEDs) connected in series and provides the necessary regulated current to control the brightness and the color purity. An external resistor R_{SET} controls the output current level. LED currents of up to 40mA can be supported over a wide range of input supply voltages from 2V to 7V, making the device ideal for battery-powered applications.

A high voltage output stage allows up to 4 White LEDs to be driven in series. Series drive provides inherent current matching.

LED dimming can be done by using a DC voltage, a logic signal, or a pulse width modulation (PWM) signal. The shutdown input pin allows the device to be placed in power-down mode with “near zero” quiescent current.

In addition to overcurrent limiting protection, the device also includes detection circuitry to ensure protection against open-circuit load fault conditions.

The device is available in a low profile (1mm max height) 6-lead TSOT-23 package and in an 8-pad TDFN (0.8mm max height) package.

CAT32TDI-GT3	TSOT23-6	3000	VF

PIN CONFIGURATION

PIN DESCRIPTION

Pin Number SOT23	Pin Number TDFN	Name	Function
1	8	SW	Switch pin. This is the drain of the internal power switch. For minimum EMI, minimize the trace area connected to this pin.
2	5	GND	Ground pin. Connect pin 2 to ground.
3	6	LED	LED (cathode) connection pin.
4	4	RSET	RESET pin. A resistor connected from pin 4 to ground sets the LED current. This pin is also used to dim the LEDs.
5	3	SHDN	Shutdown pin.
6	2	VIN	Input supply pin. This pin should be bypassed with a capacitor to ground. A 4.7 μF capacitor mounted close to the pin is recommended.
—	1	Power Ground	Power Ground

ABSOLUTE MAXIMUM RATINGS ⁽¹⁾

Parameter	Rating	Unit
V _{IN} , LED, SHDN voltage	8	V
SW voltage	20	V
RSET voltage	1	V
Storage Temperature Range	-65 to +150	°C
Junction Temperature	125	°C
Lead Soldering Temperature (10 secs)	300	°C

	Switch Leakage Current	Switch Off, V _{SW} = 5V		0.01	5	μA
	Efficiency	Components shown on Figure 1		83		%

Notes:

(1) These are stress ratings only and functional operation is not implied. Exposure to absolute maximum ratings for prolonged time periods may affect device reliability. All voltages are with respect to ground.

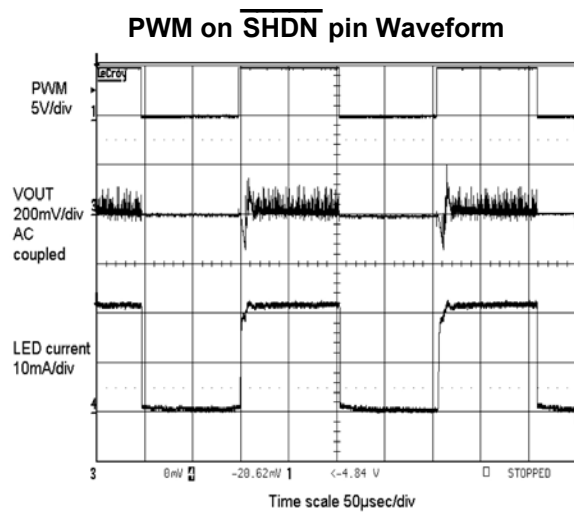

TYPICAL CHARACTERISTICS

$V_{IN} = 3.6V$, $T_{AMB} = 25^{\circ}C$, $C_{IN} = 4.7\mu F$, $C_{OUT} = 1\mu F$, $L = 6.8\mu H$, unless otherwise specified.

TYPICAL CHARACTERISTICS

$V_{IN} = 3.6V$, $T_{AMB} = 25^{\circ}C$, $C_{IN} = 4.7\mu F$, $C_{OUT} = 1\mu F$, $L = 6.8\mu H$, unless otherwise specified.

OPERATION

The CAT32 device is a high efficiency, constant frequency, current regulating boost converter.

The device includes a switch and an internally compensated loop for the regulation of the LED current.

Operation can be best understood by examining the block diagram. The RSET pin is regulated at 100mV and the current through the external resistor will set the regulated current in the LEDs (from 5mA to 40mA) with a multiplication factor of 225.

While maintaining LED current regulation, the CAT32 automatically adjusts the LED pin voltage to be as low

as possible. A low LED pin voltage ensures high efficiency.

Current through the internal power switch is continuously monitored cycle-by-cycle. If the current limit is exceeded, the switch is immediately turned off, protecting the device, for the remainder of the cycle.

PWM dimming operation can be achieved by switching the $\overline{\text{SHDN}}$ pin or by pulling the RSET pin higher than 0.1V.

CLQ4D10-6R8	6.8	195	1.2		

CAPACITOR SELECTION

Low ESR (equivalent series resistance) capacitors should be used at the output to minimize the output ripple voltage. The low ESR and small package options available with multilayer ceramic capacitors make them excellent choices. The X5R and X7R capacitor types are preferred because they retain their capacitance over wider voltage and temperature ranges than the Y5V or Z5U types. A 1.0 μ F or 2.2 μ F output capacitor is recommended for most applications.

The voltage rating of the output capacitor C2 depends on the number of LEDs driven in series. A 10V ceramic capacitor is recommended when driving two LEDs. A 16V ceramic capacitor is recommended when driving 3 or 4 LEDs.

Low profile ceramic capacitors with a 1mm maximum height/thickness are available for designs height requirements. Ceramic capacitors also make a good choice for the input capacitor, which should be mounted as close as possible to the CAT32. A 2.2 μ F or 4.7 μ F input capacitor is recommended. Table 2 shows a list of several ceramic capacitor manufacturers. Consult the manufacturers for detailed information as new products and package options are introduced regularly.

DIODE SELECTION

Schottky diodes, with their low forward voltage drop and fast switching speed, are the ideal choice for high efficiency applications. Table 3 shows several different Schottky diodes that work well with the CAT32. Make sure that the diode has a voltage rating greater than the output voltage. The diode conducts current only when the power switch is turned off (typically less than one-third the time), so a 0.4A or 0.5A diode will be sufficient for most designs.

LED CURRENT PROGRAMMING

The LED current is programmed with a single resistor connected to the RSET pin. The RSET pin is internally regulated to 100mV, which sets the current flowing out of this pin, ISET, equal to 100mV/RSET. The CAT32 regulates the current into the LED pin, ILED, to 225 times the value of ISET. For the best accuracy, a 1% or better resistor is recommended. Table 4 shows several typical 1% RSET values.

Table 4: RSET Resistor Values

ILED (mA)	RSET
40	562Ω
30	750Ω
25	909Ω
20	1.13kΩ
15	1.50kΩ
10	2.26kΩ
5	4.53kΩ

For other LED current values, use the following equation to choose RSET.

$$R_{SET} = 255 \times \frac{0.1V}{I_{LED}}$$

Most white LEDs are driven at maximum currents of 15mA to 20mA. Some higher power designs will use

two parallel strings of LEDs for greater light output, resulting in 30mA to 40mA (two strings of 15mA to 20mA) flowing into the LED pin.

LED DIMMING WITH PWM SIGNAL

PWM brightness control provides the widest dimming range (greater than 20:1). By turning the LEDs ON and OFF using the control signal the LEDs operate at either zero or full current, but their average current changes with the PWM signal duty cycle. Typically, a 5kHz to 40kHz PWM signal is used. PWM dimming with the CAT32 can be accomplished two different ways.

The SHDN pin can be driven directly or a resistor can be added to drive the RSET pin. If the SHDN pin is used, increasing the duty cycle will increase the LED brightness. Using this method, the LEDs can be dimmed and turned off completely using the same control signal. A 0% duty cycle signal will turn off the CAT32, reducing the total quiescent current to near zero.

$$R_{PWM} = R_{SET} \times \left(\frac{V_{MAX}}{0.15V} - 1 \right)$$

If the RSET pin is used, increasing the duty cycle will decrease the brightness. Using this method, the LEDs are dimmed using RSET and turned off completely using SHDN. If the RSET pin is used to provide PWM dimming, the approximate value of R_{PWM} should be calculated (where V_{MAX} is the “HIGH” value of the PWM signal):

In addition to providing the widest dimming range, PWM brightness control also ensures the “purest” white LED color over the entire dimming range. The true color of a white LED changes with operating current, and is the “purest” white at a specific forward current, usually 15mA or 20mA. If the LED current is less than or more than this value, the emitted light becomes more blue. Applications involving color LCDs can find the blue tint objectionable.

When a PWM control signal is used to drive the SHDN pin of the CAT32, the LEDs are turned off and on at the PWM frequency. The current through them alternates between full current and zero current, so the average current changes with duty cycle. This ensures that when the LEDs are on, they can be driven at the appropriate current to give the purest white light. LED brightness varies linearly with the PWM duty cycle.

LED DIMMING WITH A LOGIC SIGNAL

For applications that need to adjust the LED brightness in discrete steps, a logic signal can be used. R_{MIN} sets the minimum LED current value (when the NMOS is OFF):

$$R_{MIN} = 255 \times \frac{0.1V}{I_{LED(MIN)}}$$

R_{INCR} determines how much LED current increases when the external NMOS switch is turned ON.

$$R_{INCR} = 255 \times \frac{0.1V}{I_{LED(Increase)}}$$

LED DIMMING WITH A DC VOLTAGE

$$R_{ADJ} = 225 \times \frac{V_{MAX} - 0.1V}{I_{LED(MAX)} - I_{LEAD(MIN)}}$$

PCB Layout Guidelines

The CAT32 is a high-frequency switching regulator and therefore proper PCB board layout and component placement can minimize noise and radiation and increase efficiency. To maximize efficiency, the CAT32 design has fast switch rise and fall times. To prevent radiation and high frequency resonance problems minimize the length and area of all traces connected to the SW pin and use a ground plane under the switching regulator.

The switch, schottky output diode and output capacitor signal path should be kept as short as possible. The ground connection for the R_{SET} resistor should be tied directly to the GND pin and not be shared with other components.
