## High-Efficiency, 26 V Step-Up Converters for Two to Six White LEDs

## General Description

The MAX1561/MAX1599 step-up converters drive up to six white LEDs with a constant current to provide backlight in cell phones, PDAs, and other hand-held devices. The step-up converter topology allows series connection of the white LEDs so the LED currents are identical for uniform brightness. This configuration eliminates the need for ballast resistors and expensive factory calibration.
The MAX1561/MAX1599 include an internal, high-voltage, low-RDS(ON) N-channel MOSFET switch for high efficiency and maximum battery life. A single Dual Mode ${ }^{\text {TM }}$ input provides a simple means of brightness adjustment and on/off control. Fast $1 \mathrm{MHz}(500 \mathrm{kHz}$ for the MAX1599) current-mode, pulse-width modulated (PWM) operation allows for small input and output capacitors and a small inductor while minimizing ripple on the input supply/battery. Programmable soft-start eliminates inrush current during startup.
Both devices are available in a space-saving, 8-pin 3mm $x 3 \mathrm{~mm}$ thin DFN package with exposed paddle (EP).

Applications
Cell Phones and Smart Phones
PDAs, Palmtops, and Wireless Handhelds
e-Books and Subnotebooks
White LED Display Backlighting
Typical Operating Circuit

- Accurate Current Regulation for Uniform Illumination
- High Efficiency Up to 87\%
- Flexible Analog or PWM Dimming Control
- Up to 900mW Output Power with Internal 30V MOSFET Switch
- Fast 1MHz (MAX1561) or 500kHz (MAX1599) PWM Operation
- Small, Low-Profile External Components
- 2.6V to 5.5V Input Range
- 26V (max) Output with Overvoltage Protection
- Optimized for Low 15mVp-p Input Ripple
- Soft-Start with Zero Inrush Current
- $0.3 \mu \mathrm{~A}$ Shutdown Current
- Tiny 8-Pin 3mm x 3mm Thin DFN Package

LINE-TRANSIENT RESPONSE

# High-Efficiency, 26 V Step-Up Converters for Two to Six White LEDs 

| PIN | NAME | FUNCTION |
| :---: | :---: | :--- |
| 1 | OUT | Overvoltage Sense. When VOUT is greater than 27V, the internal N-channel MOSFET turns off until Vout <br> drops below 25V, then the IC reenters soft-start. Connect a 0.1 $\mu$ F capacitor from OUT to PGND. |
| 2 | IN | Input Voltage Supply. Input voltage range is 2.6V to 5.5V. Connect a 2.2 $\mu$ F capacitor from IN to PGND. |
| 3 | CTRL | Brightness Control Input. LED brightness is controlled by the voltage applied to CTRL. Varying the voltage <br> from 0.24V to 1.62V adjusts the brightness from dim to bright, respectively. Any voltage above 1.62V does <br> not increase brightness. If CTRL is held below 100mV for more than 8.2ms (16.4ms for the MAX1599), the <br> IC shuts down. |
| 4 | CS | Current-Sense Feedback Input. Connect a resistor from CS to GND to set the LED bias current. The <br> voltage at CS regulates to VCTRL / 10 or 0.162V, whichever is lower. |
| 5 | COMP | Compensation Input. Connect a 0.1 $\mu$ F capacitor (CcOMP) from COMP to GND. CCOMP stabilizes the <br> converter and controls soft-start. CcOMP discharges to GND when in shutdown. |
| 6 | GND | Ground. Connect to PGND and the exposed pad directly under the IC. |
| 7 | PGND | Power Ground. Connect to GND and the exposed pad directly under the IC. |
| 8 | LX | Inductor Connection. This pin is high impedance during shutdown. |
| Exposed <br> Pad | EP | Ground. Connect directly to GND and PGND under the IC. |

## Detailed Description

The MAX1561/MAX1599s' high efficiency and small size make them ideally suited to drive up to six series-connected LEDs. The device operates as a boost DC-DC converter that regulates output current rather than voltage. The MAX1561/MAX1599 provide even illumination by sourcing the same output current through each LED, eliminating the need for expensive factory calibration. The fast $1 \mathrm{MHz}(500 \mathrm{kHz}$ for the MAX1599) internal oscillator allows for a small inductor and small input and output capacitors while minimizing input and output ripple.
The single analog control input allows easy adjustment of LED brightness and on/off control. This allows either simple logic-level on/off control, analog voltage control, or PWM duty-cycle control of both brightness and shutdown. In shutdown, supply current is reduced to a low $0.3 \mu \mathrm{~A}$. A soft-start gradually illuminates the LEDs, eliminating the inrush current during startup.

## Soft-Start

The MAX1561/MAX1599 attain soft-start by charging Ccomp gradually with a current source. When Vcomp rises above 1.25 V , the internal MOSFET begins switching at a reduced duty cycle. When $V_{\text {COMP }}$ rises above 2.25 V , the duty cycle is at its maximum. See the Typical Operating Characteristics for an example of soft-start operation.

## Shutdown

The MAX1561/MAX1599 enter shutdown when VCTRL is less than 100 mV for more than 8.2 ms ( 16.4 ms for the MAX1599). In shutdown, supply current is reduced to $0.3 \mu \mathrm{~A}$ by powering down the entire IC except for the CTRL voltage-detection circuitry. CCOMP is discharged during shutdown, allowing the device to reinitiate softstart when it is enabled. Although the internal N -channel MOSFET does not switch in shutdown, there is still a DC current path between the input and the LEDs through the inductor and Schottky diode. The minimum forward voltage of the LED array must exceed the maximum input voltage to ensure that the LEDs remain off in shutdown. However, with two or more LEDs, the forward voltage is large enough to keep leakage current low, less than $1 \mu \mathrm{~A}$ (typ). Typical shutdown timing characteristics are shown in the Typical Operating Characteristics.

Overvoltage Protection Overvoltage lockout (OVLO) occurs when Vout is above 27 V . The protection circuitry stops the internal MOSFET from switching and causes Vcomp to decay to OV . The device comes out of OVLO and into softstart when VOUT falls below 25 V .

## High-Efficiency, 26 V Step-Up Converters for Two to Six White LEDs

Figure 1. Functional Diagram

## Design Procedure

## Adjusting LED Current

Adjusting the MAX1561/MAX1599s' output current changes the brightness of the LEDs. An analog input (CTRL) and the sense-resistor value set the output current. Output current is given by:

$$
I_{\text {LED }}=\frac{V_{\text {CTRL }}}{10 \times R_{\text {SENSE }}}
$$

The $\mathrm{V}_{\text {CTRL }}$ voltage range for adjusting output current is 0.24 V to 1.62 V . To set the maximum current, calculate RSENSE when $V_{\text {CTRL }}$ is at its maximum as follows:

$$
\mathrm{R}_{\mathrm{SENSE}}=\frac{1.62 \mathrm{~V}}{10 \times \mathrm{I}_{\mathrm{LED}(\mathrm{MAX})}}
$$

Power dissipation in RSENSE is typically less than 5 mW , making a standard chip resistor sufficient.

## PWM Dimming Control

CTRL is also used as a digital input allowing LED brightness control with a logic-level PWM signal applied directly to CTRL. The frequency range is from 200 Hz to 200 kHz , while $0 \%$ duty cycle corresponds to zero current and $100 \%$ duty cycle corresponds to full current. The error amplifier and compensation capacitor form a lowpass filter so PWM dimming results in DC current to the LEDs without the need for any additional RC filters; see the Typical Operating Characteristics.

Capacitor Selection
The exact values of input and output capacitors are not critical. The typical value for the input capacitor is $2.2 \mu \mathrm{~F}$ and the typical value for the output capacitor is $0.1 \mu \mathrm{~F}$. Larger value capacitors can be used to reduce

# High-Efficiency, 26 V Step-Up Converters for Two to Six White LEDs 

input and output ripple, but at the expense of size and higher cost. CCOMP stabilizes the converter and controls soft-start. Connect a $0.1 \mu \mathrm{~F}$ capacitor from COMP to GND. For stable operation, Cout must not exceed 10 times Ccomp.

## Inductor Selection

Inductor values range from $10 \mu \mathrm{H}$ to $47 \mu \mathrm{H}$. A $22 \mu \mathrm{H}$ ( $47 \mu \mathrm{H}$ for the MAX1599) inductor optimizes the efficiency for most applications while maintaining low 15 mV P-P input ripple. With input voltages near 5V, a larger value of inductance can be more efficient. To prevent core saturation, ensure that the inductor-saturation current rating exceeds the peak inductor current for the application. Calculate the peak inductor current with the following formula:

$$
\mathrm{I}_{\mathrm{PEAK}}=\frac{\mathrm{V}_{\mathrm{OUT}(\mathrm{MAX})} \times \mathrm{I}_{\mathrm{LED}(\mathrm{MAX})}}{0.8 \times \mathrm{V}_{\mathrm{IN}(\mathrm{MIN})}}+\frac{\mathrm{V}_{\mathrm{IN}(\mathrm{MIN})} \times 0.8 \mu \mathrm{~S}}{2 \times \mathrm{L}}
$$

Schottky Diode Selection
The MAX1561/MAX1599s' high switching frequency demands a high-speed rectification diode (D1) for optimum efficiency. A Schottky diode is recommended due to its fast recovery time and low forward-voltage drop. Ensure that the diode's average and peak current rating exceed the average output current and peak inductor current. In addition, the diode's reverse breakdown voltage must exceed Vout. The RMS diode current can be calculated from:

$$
I_{\text {DIODE(RMS) }} \cong \sqrt{I_{\text {OUT }} \times I_{\text {PEAK }}}
$$

## Applications Information

PC Board Layout
Due to fast switching waveforms and high-current paths, careful PC board layout is required. An evaluation kit (MAX1561EVKIT) is available to speed design. Order MAX1599 samples separately.
When laying out a board, minimize trace lengths between the IC and RSENSE, the inductor, the diode, the input capacitor, and the output capacitor. Keep traces short, direct, and wide. Keep noisy traces, such as the LX node trace, away from CS. The IN bypass capacitor (CIN) should be placed as close to the IC as possible. PGND and GND should be connected directly to the exposed paddle underneath the IC. The ground connections of CIN and Cout should be as close together as possible. The traces from IN to the inductor and from the Schottky diode to the LEDs may be longer.
