

# 8-Port, 36V Constant-Current LED Driver

## General Description

The MAX6970 serial-interfaced LED driver provides eight open-drain, constant-current-sinking LED driver outputs rated at 36V. The device operates from a 3V to 5.5V supply. The MAX6970 supply and the LEDs' supply can power up in any order. The constant-current outputs are programmed together up to 55mA using a single external resistor. The MAX6970 operates with a 25Mbps, industry-standard, 4-wire serial interface.

The MAX6970 uses the industry-standard shift-register-plus-latch-type serial interface. The driver accepts data shifted into an 8-bit shift register using data input DIN and clock input CLK. Input data appears at output DOUT eight clock cycles later to allow cascading of multiple MAX6970s. The latch-enable input, LE, loads the 8 bits of shift register data into an 8-bit output latch to set which LEDs are on and which are off. The output-enable input, OE, gates all eight outputs on and off, and is fast enough to be used as a PWM input for LED intensity control.

For applications requiring LED fault detection, refer to the MAX6981 data sheet that automatically detects open-circuit LEDs.

For safety-related applications requiring a watchdog timer, refer to the MAX6980 data sheet, which includes a fail-safe feature that blanks the display if the serial interface becomes inactive for more than 1s.

The MAX6970 is one of a family of 10 shift-register-plus-latch-type LED drivers. The family includes 8-port and 16-port types, with 5.5V- or 36V-rated LED outputs, with and without open-circuit LED detection and watchdog. All versions operate from a 3V to 5.5V supply, and are specified over the -40°C to +125°C temperature range.

## Applications

- Variable Message Signs
- Marquee Displays
- Point-of-Order Signs
- Traffic Signs
- Gaming Features
- Architectural Lighting

## Features

- ◆ 25Mbps Industry-Standard 4-Wire Serial Interface at 5V
- ◆ 3V to 5.5V Logic Supply
- ◆ Eight Constant-Current LED Outputs Rated at 36V
- ◆ Up to 55mA Continuous Current per Output
- ◆ Output Current Programmed by Single Resistor
- ◆ 3% Current Matching Between Outputs
- ◆ 6% Current Matching Between ICs
- ◆ -40°C to +125°C Temperature Range

## Ordering Information

PART	TEMP RANGE	PIN-PACKAGE	PKG CODE
MAX6970AUE	-40°C to +125°C	16 TSSOP-EP*	U16E-3
MAX6970AAE	-40°C to +125°C	16 SSOP	P16-1

\*EP = Exposed pad.

Typical Application Circuit and Selector Guide appear at end of data sheet.

## Pin Configuration

# 8-Port, 36V Constant-Current LED Driver

## ABSOLUTE MAXIMUM RATINGS

(Voltage with respect to GND.)

V+	-0.3V to +6V
OUT_	-0.3V to +40V
DIN, CLK, LE, $\overline{OE}$ , SET	-0.3V to (V+ + 0.3V)
DOUT Current	±10mA
OUT_ Sink Current	60mA
Total GND Current	480mA

Continuous Power Dissipation ( $T_A = +70^\circ\text{C}$ )

16-Pin TSSOP-EP	1702mW
(derate 21.3mW/ $^\circ\text{C}$ above $+70^\circ\text{C}$ )	
16-Pin SSOP (derate 7.1mW/ $^\circ\text{C}$ above $+70^\circ\text{C}$ )	571mW
Operating Temperature Range	-40 $^\circ\text{C}$ to +125 $^\circ\text{C}$
Junction Temperature	+150 $^\circ\text{C}$
Storage Temperature Range	-65 $^\circ\text{C}$ to +150 $^\circ\text{C}$
Lead Temperature (soldering, 10s)	+300 $^\circ\text{C}$

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## ELECTRICAL CHARACTERISTICS

(Typical Operating Circuit, V+ = 3V to 5.5V,  $T_A = T_{\text{MIN}}$  to  $T_{\text{MAX}}$ , unless otherwise noted. Typical values are at V+ = 5V,  $T_A = +25^\circ\text{C}$ .) (Note 1)

PARAMETER	SYMBOL	CONDITIONS	MIN	TYP	MAX	UNITS

# 8-Port, 36V Constant-Current LED Driver

## Pin Description

PIN	NAME	FUNCTION
1	GND	Ground
2	DIN	Serial-Data Input. Data is loaded into the internal 8-bit shift register on CLK's rising edge.
3	CLK	Serial-Clock Input. Data is loaded into the internal 8-bit shift register on CLK's rising edge.
4	LE	Load-Enable Input. Data is loaded transparently from the internal shift register to the output latch while LE is high. Data is latched into the output latch on LE's falling edge and retained while LE is low.
5–12	OUT0–OUT7	LED Driver Outputs. OUT0 to OUT7 are open-drain, constant-current-sinking outputs rated to 36V.
13	$\overline{OE}$	Output-Enable Input. High forces outputs OUT0 to OUT7 high impedance without altering the contents of the output latches. Low enables outputs OUT0 to OUT7 to follow the state of the output latches.
14	DOUT	Serial-Data Output. Data is clocked out of the 8-bit internal shift-register to DOUT on CLK's rising edge.
15	SET	LED Current Setting. Connect SET to GND through a resistor ( $R_{SET}$ ) to set the maximum LED current.
16	V+	Positive Supply Voltage. Bypass V+ to GND with a 0.1 $\mu$ F ceramic capacitor.
EP (TSSOP)	—	Exposed Pad. Although not required, connecting EP to ground improves thermal performance.

## Detailed Description

The MAX6970 LED driver comprises a 4-wire serial interface driving eight constant-current-sinking, open-drain output ports. The outputs drive LEDs in either static or multiplex applications (Figure 1). The constant-current outputs are guaranteed for current accuracy, not only with chip-supply voltage variations (5V  $\pm$ 10% and 3V to 5.5V), but also over a realistic range of driver output voltage drop (0.8V to 2.5V). The drivers use current-sensing feedback circuitry (not simple current mirrors) to ensure very small-current variations over the full allowed range of output voltage (see the *Typical Operating Characteristics*).

The 4-wire serial interface comprises an 8-bit shift register and an 8-bit transparent latch. The shift register is written through a clock input, CLK, and a data input, DIN, and the data propagates to a data output, DOUT. The data output allows multiple drivers to be cascaded and operated together. The contents of the 8-bit shift register are loaded into the transparent latch through a latch-enable input, LE. The latch is transparent to the shift register outputs when high, and latches the current state on the falling edge of LE.

Each driver output is an open-drain, constant-current sink, which should be connected to the cathode of either a single LED or a series string of multiple LEDs. The LED anode can be connected to a supply voltage of up to 36V, independent of the MAX6970 supply, V+. The constant-current capability is up to 55mA per output, set for all eight outputs by an external resistor,  $R_{SET}$ .

## 4-Wire Serial Interface

The serial interface on the MAX6970 is a 4-wire serial interface, using four inputs (DIN, CLK, LE,  $\overline{OE}$ ) and a data output (DOUT). This interface is used to write display data to the MAX6970. The serial-interface data word length is 8 bits, D0–D7. See Figures 2 and 3.

The functions of the five interface pins are as follows. DIN is the serial-data input, and must be stable when it is sampled on the rising edge of CLK. Data is shifted in, MSB first. This means that data bit D7 is clocked in first, followed by 7 more data bits, finishing with the LSB D0.

CLK is the serial-clock input, which shifts data at DIN into the MAX6970's 8-bit shift register on its rising edge.

LE is the load input latch that transfers data from the MAX6970 8-bit shift register to its 8-bit latch when LE is high (transparent latch), and latches the data on the falling edge of LE (Figure 2).

The fourth input provides output-enable control of the output drivers.  $\overline{OE}$  is high to force outputs OUT0 to OUT7 high impedance without altering the contents of the output latches, and low to enable outputs OUT0 to OUT7 to follow the state of the output latches.

$\overline{OE}$  is independent of the serial-interface operation. Data can be shifted into the serial-interface shift register and latched regardless of the state of  $\overline{OE}$ .

DOUT is the serial-data output, which shifts data out from the MAX6970's 8-bit shift register on the rising edge of CLK. Data at DIN is propagated through the shift register and appears at DOUT eight clock cycles later. See Figure 2.

### Applications Information

#### Selecting External Component R<sub>SET</sub> to Set LED Output Current

The MAX6970 uses an external resistor R<sub>SET</sub> to set the LED current for outputs OUT0 to OUT7. The minimum allowed value of R<sub>SET</sub> is 327.3Ω, which sets the output currents up to 55mA. The reference value, 360Ω, sets the output currents to 50mA. To set a different output current, use the formula:

$$R_{SET} = 18,000 / I_{OUT}$$

where I<sub>OUT</sub> is the desired output current in mA.

#### Computing Power Dissipation

The upper limit for power dissipation (P<sub>D</sub>) for the MAX6970 is determined from the following equation:

$$P_D = (V_+ \times I_+) + (V_{OUT} \times DUTY \times I_{OUT} \times N)$$

where:

V<sub>+</sub> = supply voltage

I<sub>+</sub> = operating supply current when sinking I<sub>OUT</sub> LED drive current into N outputs

DUTY = PWM duty cycle applied to  $\overline{OE}$

N = number of MAX6970 outputs driving LEDs at the same time (maximum is eight)

V<sub>OUT</sub> = MAX6970 port output voltage when driving load LED(s)

I<sub>OUT</sub> = LED drive current programmed by R<sub>SET</sub>

P<sub>D</sub> = power dissipation, in mW if currents are in mA.

Dissipation example:

I<sub>OUT</sub> = 50mA, N = 8, DUTY = 1, V<sub>OUT</sub> = 2V, V<sub>+</sub> = 5.25V

$$P_D = (5.25V \times 25mA) + (2V \times 1 \times 50mA \times 8) = 0.931W.$$

Thus, for a 16-pin TSSOP package (T<sub>JA</sub> = 1 / 0.0213 = +46.95°C/W from the *Absolute Maximum Ratings*), the maximum allowed ambient temperature T<sub>A</sub> is given by:

$$T_{J(MAX)} = T_A + (P_D \times T_{JA}) = +150^\circ C = T_A + (0.931 \times 46.95^\circ C/W)$$

so T<sub>A</sub> = +106.3°C.

#### Overtemperature Cutoff

The MAX6970 contains an internal temperature sensor that turns off all outputs when the die temperature exceeds approximately +165°C. The outputs are re-enabled again when the die temperature drops below approximately +140°C. Register contents are not affected, so when a driver is overdissipating, the external symptom is the load LEDs cycling between on and off as the driver repeatedly overheats and cools, alternately turning the LEDs off and then back on again.

#### Power-Supply Considerations

The MAX6970 operates with a chip supply V<sub>+</sub>, and one or more LED supplies. Bypass each supply to GND with a 0.1μF capacitor as close to the MAX6970 as possible. This is normally adequate for static LED driving. For multiplex or PWM applications, it is necessary to add an additional bulk electrolytic capacitor of 4.7μF or more to each supply for every four to 16 MAX6970s. The necessary capacitance depends on the LED load current, PWM switching frequency, and serial-interface speed. Inadequate V<sub>+</sub> decoupling can cause timing problems, and very noisy LED supplies can affect LED current regulation.
