## 155Mbps to 622Mbps SFF/SFP Laser Driver with Extinction Ratio Control

MAX3646

### General Description

The MAX3646 is a +3.3V laser driver designed for multirate transceiver modules with data rates from 155Mbps to 622Mbps. Lasers can be DC-coupled to the MAX3646 for reduced component count and ease of multirate operation.

Laser extinction ratio control (ERC) combines the features of automatic power control (APC), modulation compensation, and built-in thermal compensation. The APC loop maintains constant average optical power. Modulation compensation increases the modulation current in proportion to the bias current. These control loops, combined with thermal compensation, maintain a constant optical extinction ratio over temperature and lifetime.

The MAX3646 accepts differential data input signals. The wide 5mA to 60mA (up to 85mA AC-coupled) modulation current range and up to 100mA bias current range, make the MAX3646 ideal for driving FP/DFB lasers in fiber optic modules. External resistors set the required laser current levels. The MAX3646 provides transmit disable control (TX\_DISABLE), single-point fault tolerance, bias-current monitoring, and photocurrent monitoring. The device also offers a latched failure output (TX\_FAULT) to indicate faults, such as when the APC loop is no longer able to maintain the average optical power at the required level. The MAX3646 is compliant with the SFF-8472 transmitter diagnostic and SFP MSA timing requirements.

The MAX3646 is offered in a 4mm x 4mm, 24-pin thin QFN package and operates over the extended -40°C to +85°C temperature range.

### Applications

Multirate OC-3 to OC-12 FEC Transceivers  
125Mbps Ethernet SFP, GBIC, and 1 x 9  
Transceivers

Typical Application Circuit appears at end of data sheet.

### Features

- ◆ Single +3.3V Power Supply
- ◆ 47mA Power-Supply Current
- ◆ 85mA Modulation Current
- ◆ 100mA Bias Current
- ◆ Automatic Power Control (APC)
- ◆ Modulation Compensation
- ◆ On-Chip Temperature Compensation
- ◆ Self-Biased Inputs for AC-Coupling
- ◆ Ground-Referenced Current Monitors
- ◆ Laser Shutdown and Alarm Outputs
- ◆ Enable Control and Laser Safety Feature

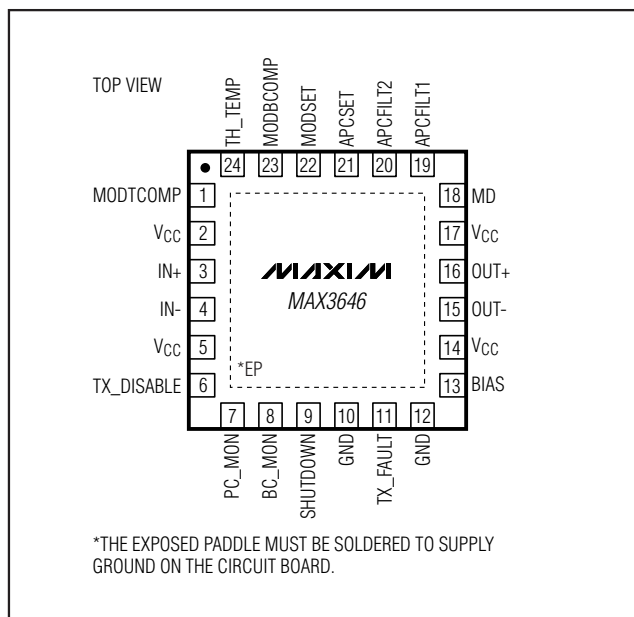

### Ordering Information

PART	TEMP RANGE	PIN-PACKAGE
MAX3646ETG	-40°C to +85°C	24 Thin QFN-EP*
MAX3646ETG+	-40°C to +85°C	24 Thin QFN-EP*

+Denotes a lead-free/RoHS-compliant package.

\*EP = Exposed pad.

# 155Mbps to 622Mbps SFF/SFP Laser Driver with Extinction Ratio Control

## ABSOLUTE MAXIMUM RATINGS

Supply Voltage $V_{CC}$ .....-0.5V to +6.0V	OUT+, OUT-, BIAS Current.....-20mA to +150mA
IN+, IN-, TX_DISABLE, TX_FAULT, SHUTDOWN, BC_MON, PC_MON, APCFLT1, APCFLT2, MD, TH_TEMP, MODTCOMP, MODBCOMP, MODSET, and APCSET Voltage.....-0.5V to ( $V_{CC} + 0.5V$ )	Continuous Power Dissipation ( $T_A = +85^{\circ}C$ ) 24-Pin TQFN (derate 20.8mW/ $^{\circ}C$ above +85 $^{\circ}C$ ) ..... 1805mW Operating Junction Temperature Range.....-55 $^{\circ}C$ to +150 $^{\circ}C$ Storage Temperature Range .....-55 $^{\circ}C$ to +150 $^{\circ}C$

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## ELECTRICAL CHARACTERISTICS

( $V_{CC} = +2.97V$  to +3.63V,  $T_A = -40^{\circ}C$  to +85 $^{\circ}C$ . Typical values are at  $V_{CC} = +3.3V$ ,  $I_{BIAS} = 60mA$ ,  $I_{MOD} = 60mA$ ,  $T_A = +25^{\circ}C$ , unless otherwise noted.) (Notes 1, 2)

## Pin Description

PIN	NAME	FUNCTION
1	MODTCOMP	Modulation-Current Compensation from Temperature. A resistor at this pin sets the temperature coefficient of the modulation current when above the threshold temperature. Leave open for zero temperature compensation.
2, 5, 14, 17	VCC	+3.3V Supply Voltage
3	IN+	Noninverted Data Input
4	IN-	Inverted Data Input
6	TX_DISABLE	Transmitter Disable, TTL. Laser output is disabled when TX_DISABLE is asserted high or left unconnected. The laser output is enabled when this pin is asserted low.
7	PC_MON	Photodiode-Current Monitor Output. Current out of this pin develops a ground-referenced voltage across an external resistor that is proportional to the monitor diode current.
8	BC_MON	Bias-Current Monitor Output. Current out of this pin develops a ground-referenced voltage across an external resistor that is proportional to the bias current.
9	SHUTDOWN	Shutdown Driver Output. Voltage output to control an external transistor for optional shutdown circuitry.
10, 12	GND	Ground
11	TX_FAULT	Open-Collector Transmit Fault Indicator (Table 1)
13	BIAS	Laser Bias-Current Output
15	OUT-	Inverted Modulation-Current Output. I <sub>MOD</sub> flows into this pin when input data is low.
16	OUT+	Noninverted Modulation-Current Output. I <sub>MOD</sub> flows into this pin when input data is high.
18	MD	Monitor Photodiode Input. Connect this pin to the anode of a monitor photodiode. A capacitor to ground is required to filter the high-speed AC monitor photocurrent.
19	APCFILT1	Connect a capacitor (C <sub>APC</sub> ) between pin 19 (APCFILT1) and pin 20 (APCFILT2) to set the dominant pole of the APC feedback loop.
20	APCFILT2	(See Pin 19)
21	APCSET	A resistor connected from this pin to ground sets the desired average optical power.
22	MODSET	A resistor connected from this pin to ground sets the desired constant portion of the modulation current.
23	MODBCOMP	Modulation-Current Compensation from Bias. Couples the bias current to the modulation current. Mirrors I <sub>BIAS</sub> through an external resistor. Leave open for zero-coupling.
24	TH_TEMP	Threshold for Temperature Compensation. A resistor at this pin programs the temperature above which compensation is added to the modulation current.
—	EP	Exposed Pad. Solder the exposed pad to the circuit board ground for specified thermal and electrical performance.

## Detailed Description

The MAX3646 laser driver consists of three main parts: a high-speed modulation driver, biasing block with ERC, and safety circuitry. The circuit design is optimized for high-speed, low-voltage (+3.3V) operation (Figure 4).

### High-Speed Modulation Driver

The output stage is composed of a high-speed differential pair and a programmable modulation current source. The MAX3646 is optimized for driving a 15Ω load. The minimum instantaneous voltage required at OUT- is 0.7V for modulation currents up to 60mA and 0.75V for currents from 60mA to 85mA. Operation above 60mA can be accomplished by AC-coupling or with sufficient voltage at the laser to meet the driver output voltage requirement.

To interface with the laser diode, a damping resistor ( $R_D$ ) is required. The combined resistance damping

resistor and the equivalent series resistance (ESR) of the laser diode should equal 15Ω. To further damp aberrations caused by laser diode parasitic inductance, an RC shunt network may be necessary. Refer to Application Note 274: *HFAN-02.0: Interfacing Maxim Laser Drivers with Laser Diodes* for more information.

Any capacitive load at the cathode of a laser diode degrades optical output performance. Because the BIAS output is directly connected to the laser cathode, minimize the parasitic capacitance associated with the pin by using an inductor to isolate the BIAS pin parasitics from the laser cathode.

### Extinction Ratio Control

The extinction ratio ( $r_e$ ) is the laser on-state power divided by the off-state power. Extinction ratio remains constant if peak-to-peak and average power are held constant:

$$r_e = (2P_{AVG} + P_{P-P}) / (2P_{AVG} - P_{P-P})$$

# 155Mbps to 622Mbps SFF/SFP Laser Driver with Extinction Ratio Control

Figure 4. Functional Diagram

Average power is regulated using APC, which keeps constant current from a photodiode coupled to the laser. Peak-to-peak power is maintained by compensating the modulation current for reduced slope efficiency ( $\eta$ ) of laser over time and temperature:

$$P_{AVG} = I_{MOD}/\rho_{MON}$$

$$P_{P-P} = \eta \times I_{MOD}$$

Modulation compensation from bias increases the modulation current by a user-selected proportion (K) needed to maintain peak-to-peak laser power as bias current

increases with temperature. Refer to Application Note 1119: *HFAN-02.2.1: Maintaining the Extinction Ratio of Optical Transmitters Using K-Factor Control* for details:

$$K = \Delta I_{MOD} / \Delta I_{BIAS}$$

This provides a first-order approximation of the current increase needed to maintain peak-to-peak power. Slope efficiency decreases more rapidly as temperature increases. The MAX3646 provides additional temperature compensation as temperature increases past a user-defined threshold ( $T_{TH}$ ).

Table 1. Typical Fault Conditions

1	If any of the I/O pins are shorted to GND or VCC (single-point failure; see Table 2), and the bias current or the photocurrent exceeds the programmed threshold.
2	End-of-life (EOL) condition of the laser diode. The bias current and/or the photocurrent exceed the programmed threshold.
3	Laser cathode is grounded and photocurrent exceeds the programming threshold.
4	No feedback for the APC loop (broken interconnection, defective monitor photodiode), and the bias current exceeds the programmed threshold.

# 155Mbps to 622Mbps SFF/SFP Laser Driver with Extinction Ratio Control

Table 2. Circuit Responses to Various Single-Point Faults

PIN	CIRCUIT RESPONSE TO OVERVOLTAGE OR SHORT TO V <sub>CC</sub>	CIRCUIT RESPONSE TO UNDERVOLTAGE OR SHORT TO GROUND
TX_FAULT	Does not affect laser power.	Does not affect laser power.
TX_DISABLE	Modulation and bias currents are disabled.	Normal condition for circuit operation.
IN+	The optical average power increases and a fault occurs if V <sub>PC_MON</sub> exceeds the threshold. The APC loop responds by decreasing the bias current.	The optical average power decreases and the APC loop responds by increasing the bias current. A fault state occurs if V <sub>BC_MON</sub> exceeds the threshold voltage.
IN-	The optical average power decreases and the APC loop responds by increasing the bias current. A fault state occurs if V <sub>BC_MON</sub> exceeds the threshold voltage.	The optical average power increases and a fault occurs if V <sub>PC_MON</sub> exceeds the threshold. The APC loop responds by decreasing the bias current.
MD	This disables bias current. A fault state occurs.	The APC circuit responds by increasing the bias current until a fault is detected, then a fault* state occurs.
SHUTDOWN	Does not affect laser power. If the shutdown circuitry is used, the laser current is disabled.	Does not affect laser power.
BIAS	In this condition, the laser forward voltage is 0V and no light is emitted.	Fault state* occurs. If the shutdown circuitry is used, the laser current is disabled.
OUT+	The APC circuit responds by increasing the bias current until a fault is detected, then a fault state* occurs.	Fault state* occurs. If the shutdown circuitry is used, the laser current is disabled.
OUT-	Does not affect laser power.	Does not affect laser power.
PC_MON	Fault state* occurs.	Does not affect laser power.
BC_MON	Fault state* occurs.	Does not affect laser power.
APCFILT1	I <sub>BIAS</sub> increases until V <sub>BC_MON</sub> exceeds the threshold voltage.	I <sub>BIAS</sub> increases until V <sub>BC_MON</sub> exceeds the threshold voltage.
APCFILT2	I <sub>BIAS</sub> increases until V <sub>BC_MON</sub> exceeds the threshold voltage.	I <sub>BIAS</sub> increases until V <sub>BC_MON</sub> exceeds the threshold voltage.
MODSET	Does not affect laser power.	Fault state* occurs.
APCSET	Does not affect laser power.	Fault state* occurs.

\*A fault state asserts the TX\_FAULT pin, disables the modulation and bias currents, and asserts the SHUTDOWN pin.

# 155Mbps to 622Mbps SFF/SFP Laser Driver with Extinction Ratio Control

**Table 3. Optical Power Relations**

PARAMETER	SYMBOL	RELATION
Average power	$P_{AVG}$	$P_{AVG} = (P_0 + P_1) / 2$
Extinction ratio	$r_e$	$r_e = P_1 / P_0$
Optical power of a one	$P_1$	$P_1 = 2P_{AVG} \times r_e / (r_e + 1)$
Optical power of a zero	$P_0$	$P_0 = 2P_{AVG} / (r_e + 1)$
Optical amplitude	$P_{P-P}$	$P_{P-P} = P_1 - P_0$
Laser slope efficiency	$\eta$	$\eta = P_{P-P} / I_{MOD}$
Modulation current	$I_{MOD}$	$I_{MOD} = P_{P-P} / \eta$
Threshold current	$I_{TH}$	$P_0$ at $I \geq I_{TH}$
Bias current (AC-coupled)	$I_{BIAS}$	$I_{BIAS} \geq I_{TH} + I_{MOD} / 2$
Laser to monitor transfer	$\rho_{MON}$	$I_{MD} / P_{AVG}$

**Note:** Assuming a 50% average input duty cycle and mark density.

### Safety Circuitry

The safety circuitry contains a disable input (TX\_DISABLE), a latched fault output (TX\_FAULT), and fault detectors (Figure 5). This circuitry monitors the operation of the laser driver and forces a shutdown if a fault is detected (Table 1). The TX\_FAULT pin should be pulled high with a 4.7k $\Omega$  to 10k $\Omega$  resistor to V<sub>CC</sub> as required by the SFP MSA. A single-point fault can be a short to V<sub>CC</sub> or GND. See Table 2 to view the circuit response to various single-point failure. The transmit fault condition is latched until reset by a toggle or TX\_DISABLE or V<sub>CC</sub>. The laser driver offers redundant laser diode shutdown through the optional shutdown circuitry as shown in the *Typical Application Circuit*. This shutdown transistor prevents a single-point fault at the laser from creating an unsafe condition.

### Safety Circuitry Current Monitors

The MAX3646 features monitors (BC\_MON, PC\_MON) for bias current (I<sub>BIAS</sub>) and photocurrent (I<sub>MD</sub>). The monitors are realized by mirroring a fraction of the currents and developing voltages across external resistors connected to ground. Voltages greater than V<sub>REF</sub> at PC\_MON or BC\_MON result in a fault state. For example, connecting a 100 $\Omega$  resistor to ground at each monitor output gives the following relationships:

$$V_{BC\_MON} = (I_{BIAS} / 82) \times 100\Omega$$

$$V_{PC\_MON} = I_{MD} \times 100\Omega$$

External sense resistors can be used for high-accuracy measurement of bias and photodiode currents. On-chip

isolation resistors are included to reduce the number of components needed to implement this function.

### Design Procedure

When designing a laser transmitter, the optical output is usually expressed in terms of average power and extinction ratio. Table 3 shows relationships that are helpful in converting between the optical average power and the modulation current. These relationships are valid if the mark density and duty cycle of the optical waveform are 50%.

For a desired laser average optical power (P<sub>AVG</sub>) and optical extinction ratio (r<sub>e</sub>), the required bias and modulation currents can be calculated using the equations in Table 3. Proper setting of these currents requires knowledge of the laser to monitor transfer ( $\rho_{MON}$ ) and slope efficiency ( $\eta$ ).

### Programming the Monitor-Diode Current Set Point

The MAX3646 operates in APC mode at all times. The bias current is automatically set so average laser power is determined by the APCSET resistor:

$$P_{AVG} = I_{MD} / \rho_{MON}$$

The APCSET pin controls the set point for the monitor diode current. An internal current regulator establishes the APCSET current in the same manner as the MODSET pin. See the I<sub>MD</sub> vs. R<sub>APCSET</sub> graph in the *Typical Operating Characteristics* and select the value of R<sub>APCSET</sub> that corresponds to the required current at +25°C:

$$I_{MD} = 1/2 \times V_{REF} / R_{APCSET}$$

The laser driver automatically adjusts the bias to maintain the constant average power. For DC-coupled laser diodes:

$$I_{AVG} = I_{BIAS} + I_{MOD} / 2$$

### Programming the Modulation Current with Compensation

Determine the modulation current from the laser slope efficiency:

$$I_{MOD} = 2 \times P_{AVG} / \eta \times (r_e - 1) / (r_e + 1)$$

The modulation current of the MAX3646 consists of a static modulation current (I<sub>MODS</sub>), a current proportional to I<sub>BIAS</sub>, and a current proportional to temperature. The portion of I<sub>MOD</sub> set by MODSET is established by an internal current regulator, which maintains the reference voltage of V<sub>REF</sub> across the external programming resistor. See the I<sub>MOD</sub> vs. R<sub>MODSET</sub> graph in the *Typical Operating Characteristics* and select the value

# 155Mbps to 622Mbps SFF/SFP Laser Driver with Extinction Ratio Control

of R<sub>MODSET</sub> that corresponds to the required current at +25°C:

$$I_{MOD} = I_{MODS} + K \times I_{BIAS} + I_{MODT}$$

$$I_{MODS} = 268 \times V_{REF} / R_{MODSET}$$

$$I_{MODT} = TC \times (T - T_{TH}) \quad I \geq T_{TH}$$

$$I_{MODT} = 0 \quad I \leq T_{TH}$$

An external resistor at the MODBCOMP pin sets current proportional to I<sub>BIAS</sub>. Open circuiting the MODBCOMP pin can turn off the interaction between I<sub>BIAS</sub> and I<sub>MOD</sub>:

$$K = 1700 / (1000 + R_{MODBCOMP}) \pm 10\%$$

If I<sub>MOD</sub> must be increased from I<sub>MOD1</sub> to I<sub>MOD2</sub> to maintain the extinction ratio at elevated temperatures, the required compensation factor is:

$$K = (I_{MOD2} - I_{MOD1}) / (I_{BIAS2} - I_{BIAS1})$$

A threshold for additional temperature compensation can be set with a programming resistor at the TH\_TEMP pin:

$$T_{TH} = -70^{\circ}\text{C} + 1.45\text{M}\Omega / (9.2\text{k}\Omega + R_{TH\_TEMP})^{\circ}\text{C} \pm 10\%$$

The temperature coefficient of thermal compensation above T<sub>TH</sub> is set by R<sub>MODTCOMP</sub>. Leaving the MODTCOMP pin open disables additional thermal compensation:

$$TC = 1 / (0.5 + R_{MODTCOMP}(\text{k}\Omega)) \text{ mA}^{\circ}\text{C} \pm 10\%$$

## Current Compliance (I<sub>MOD</sub> ≤ 60mA), DC-Coupled

The minimum voltage at the OUT+ and OUT- pins is 0.7V.

For:

V<sub>DIODE</sub> = Diode bias point voltage (1.2V typ)

R<sub>L</sub> = Diode bias point resistance (5Ω typ)

R<sub>D</sub> = Series matching resistor (20Ω typ)

For compliance:

$$V_{OUT+} = V_{CC} - V_{DIODE} - I_{MOD} \times (R_D + R_L) - I_{BIAS} \times R_L \geq 0.7\text{V}$$

## Current Compliance (I<sub>MOD</sub> > 60mA), AC-Coupled

For applications requiring modulation current greater than 60mA, headroom is insufficient from proper operation of the laser driver if the laser is DC-coupled. To avoid this problem, the MAX3646's modulation output can be AC-coupled to the cathode of a laser diode. An external pullup inductor is necessary to DC-bias the modulation output at V<sub>CC</sub>. Such a configuration isolates laser forward voltage from the output circuitry and allows the output at OUT+ to swing above and below the supply voltage (V<sub>CC</sub>). When AC-coupled, the MAX3646 modulation current can be programmed up to 85mA. Refer to Application Note 274: HFAN-02.0: Interfacing

Figure 6. Simplified Input Structure

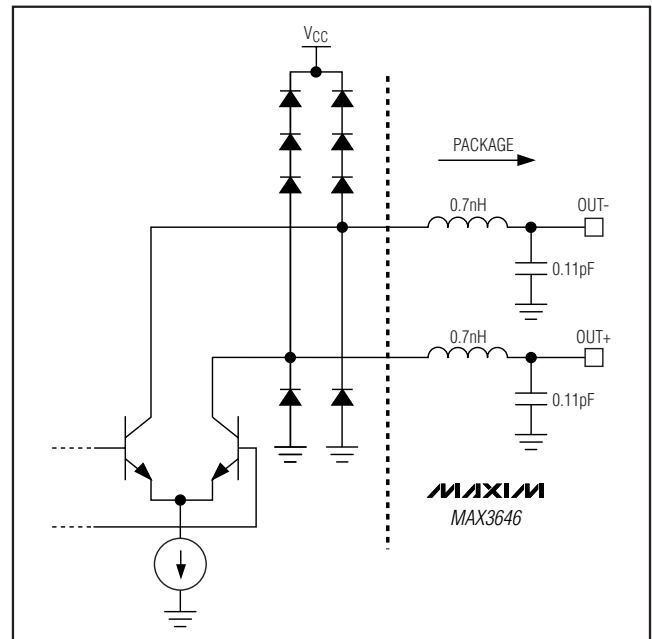

Figure 7. Simplified Output Structure

# 155Mbps to 622Mbps SFF/SFP Laser Driver with Extinction Ratio Control

Maxim Laser Drivers with Laser Diodes for more information on AC-coupling laser drivers to laser diodes.

For compliance:

$$V_{OUT+} = V_{CC} - I_{MOD} / 2 \times (R_D + R_L) \geq 0.75V$$

## Determine CAPC

The APC loop filter capacitor ( $C_{APC}$ ) must be selected to balance the requirements for fast turn-on and minimal interaction with low frequencies in the data pattern. The low-frequency cutoff is:

$$C_{APC}(\mu F) \cong 68 / (f_{3dB}(kHz) \times (\eta \times \rho_{MON}))^{1.1}$$

High-frequency noise can be filtered with an additional cap,  $C_{MD}$ , from the MD pin to ground:

$$C_{MD} \cong C_{APC} / 4$$

The MAX3646 is designed so turn-on time is faster than 1ms for most laser gain values ( $\eta \times \rho_{MON}$ ). Choosing a smaller value of  $C_{APC}$  reduces turn-on time. Careful balance between turn-on time and low-frequency cutoff may be needed at low data rates for some values of laser gain.

## Interface Models

Figures 6 and 7 show simplified input and output circuits for the MAX3646 laser driver. If dice are used, replace package parasitic elements with bondwire parasitic elements.

## Layout Considerations

To minimize loss and crosstalk, keep the connections between the MAX3646 output and the laser diode as short as possible. Use good high-frequency layout

techniques and multilayer boards with uninterrupted ground plane to minimize EMI and crosstalk. Circuit boards should be made using low-loss dielectrics. Use controlled-impedance lines for data inputs, as well as the module output.

## Laser Safety and IEC 825

Using the MAX3646 laser driver alone does not ensure that a transmitter design is IEC 825 compliant. The entire transmitter circuit and component selections must be considered. Each customer must determine the level of fault tolerance required by their application, recognizing that Maxim products are not designed or authorized for use as components in systems intended for surgical implant into the body, for applications intended to support or sustain life, or for any other application where the failure of a Maxim product could create a situation where personal injury or death may occur.

## Exposed-Pad (EP) Package

The exposed pad on the 24-pin QFN provides a very low thermal resistance path for heat removal from the IC. The pad is also electrical ground on the MAX3646 and should be soldered to the circuit board ground for proper thermal and electrical performance. Refer to Application Note 862: *HFAN-08.1: Thermal Consideration of QFN and Other Exposed-Paddle Packages* at [www.maxim-ic.com](http://www.maxim-ic.com) for additional information.

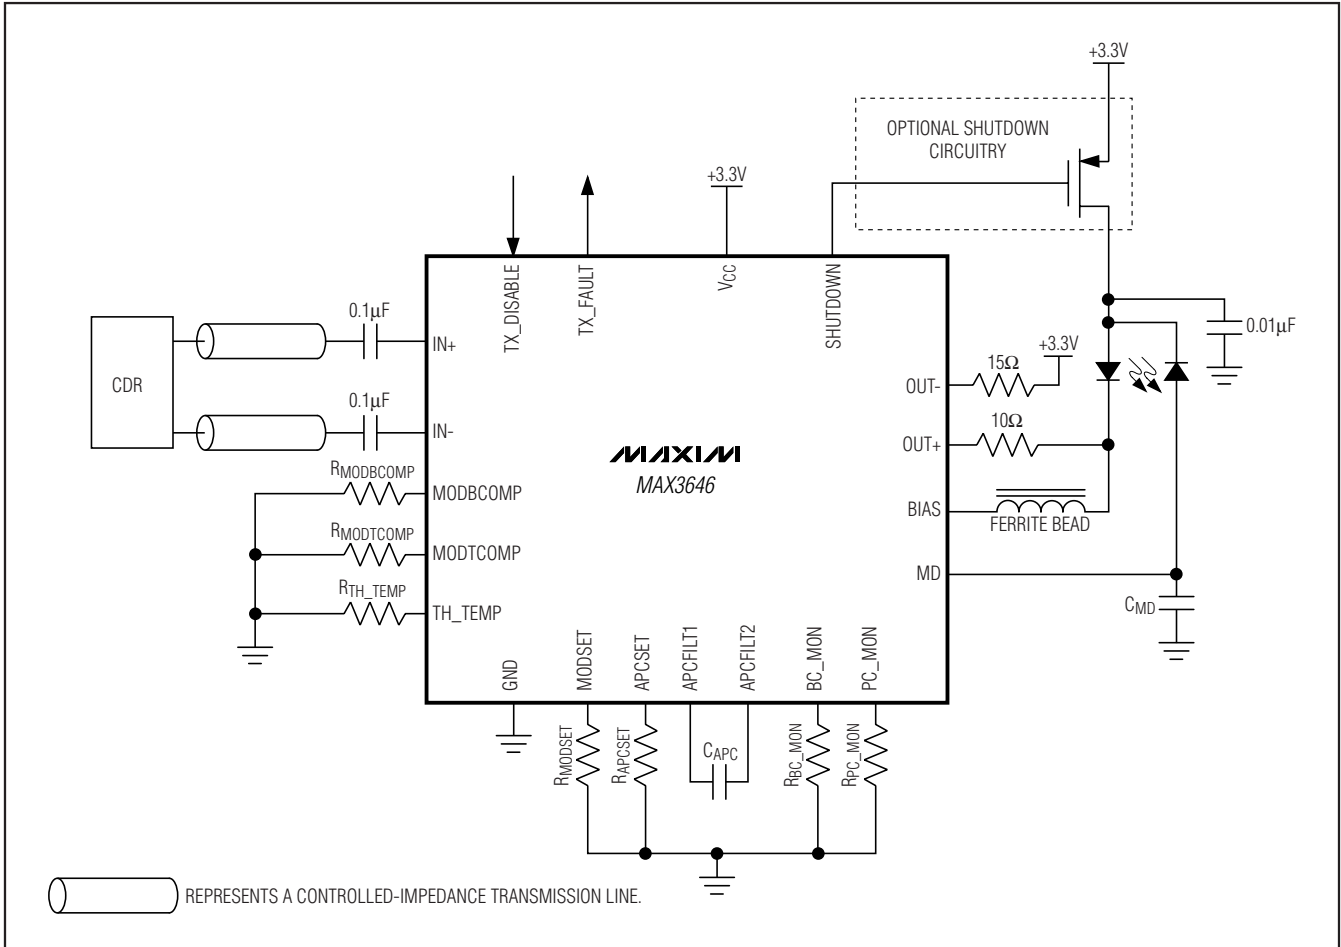

## Chip Information

TRANSISTOR COUNT: 7884

PROCESS: SiGe/BIPOLAR

# 155Mbps to 622Mbps SFF/SFP Laser Driver with Extinction Ratio Control

## Typical Application Circuit

## Package Information

For the latest package outline information and land patterns, go to [www.maxim-ic.com/packages](http://www.maxim-ic.com/packages).

PACKAGE TYPE	PACKAGE CODE	DOCUMENT NO.
24 TQFN-EP	T2444-3	<a href="#">21-0139</a>

Maxim cannot assume responsibility for use of any circuitry other than circuitry entirely embodied in a Maxim product. No circuit patent licenses are implied. Maxim reserves the right to change the circuitry and specifications without notice at any time.
