## DESCRIPTION/ORDERING INFORMATION

This single bus buffer gate is designed for 1.65-V to 5.5-V $V_{CC}$ operation.

The SN74LVC1G126-Q1 is a single line driver with a 3-state output. The output is disabled when the output-enable (OE) input is low.

To ensure the high-impedance state during power up or power down, OE should be tied to GND through a pulldown resistor; the minimum value of the resistor is determined by the current-sourcing capability of the driver.

This device is fully specified for partial-power-down applications using $I_{off}$. The $I_{off}$ circuitry disables the outputs, preventing damaging current backflow through the device when it is powered down.
