| $\overline{T C}_{\text {D }}$ | Terminal Count Down (Borrow) Output (Active LOW) | 50/33.3 | -1 mA/20 mA |
| $\overline{\mathrm{TC}}_{U}$ | Terminal Count Up (Carry) Output (Active LOW) | 50/33.3 | -1 mA/20 mA |

## Functional Description

The 74F193 is a 4-bit binary synchronous up/down (reversible) counter. It contains four edge-triggered flip-flops, with internal gating and steering logic to provide master reset, individual preset, count up and count down operations.
A LOW-to-HIGH transition on the CP input to each flip-flop causes the output to change state. Synchronous switching, as opposed to ripple counting, is achieved by driving the steering gates of all stages from a common Count Up line and a common Count Down line, thereby causing all state changes to be initiated simultaneously. A LOW-to-HIGH transition on the Count Up input will advance the count by one; a similar transition on the Count Down input will decrease the count by one. While counting with one clock input, the other should be held HIGH, as indicated in the Function Table.
The Terminal Count Up $\left(\overline{\mathrm{TC}}_{\mathrm{U}}\right)$ and Terminal Count Down ( $\overline{\mathrm{TC}}_{\mathrm{D}}$ ) outputs are normally HIGH. When the circuit has reached the maximum count state 15, the next HIGH-toLOW transition of the Count Up Clock will cause $\overline{\mathrm{TC}}_{\mathrm{U}}$ to go LOW. $\overline{\mathrm{TC}}_{U}$ will stay LOW until $\mathrm{CP}_{U}$ goes HIGH again, thus effectively repeating the Count Up Clock, but delayed by two gate delays. Similarly, the $\overline{T C}_{D}$ output will go LOW when the circuit is in the zero state and the Count Down Clock goes LOW. Since the TC outputs repeat the clock waveforms, they can be used as the clock input signals to the next higher order circuit in a multistage counter.

$$
\begin{aligned}
& \overline{\mathrm{TC}}_{\mathrm{U}}=\mathrm{Q}_{0} \cdot \mathrm{Q}_{1} \cdot \mathrm{Q}_{2} \cdot \mathrm{Q}_{3} \cdot \overline{\mathrm{CP}}_{\mathrm{U}} \\
& \overline{\mathrm{TC}}_{\mathrm{D}}=\overline{\mathrm{Q}}_{0} \cdot \overline{\mathrm{Q}}_{1} \cdot \overline{\mathrm{Q}}_{2} \cdot \overline{\mathrm{Q}}_{3} \cdot \overline{\mathrm{CP}}_{\mathrm{D}}
\end{aligned}
$$

The 74F193 has an asynchronous parallel load capability permitting the counter to be preset. When the Parallel Load $(\overline{\mathrm{PL}})$ and the Master Reset (MR) inputs are LOW, information present on the Parallel Data input $\left(\mathrm{P}_{0}-\mathrm{P}_{3}\right)$ is loaded into the counter and appears on the outputs regardless of the conditions of the clock inputs. A HIGH signal on the Master Reset input will disable the preset gates, override both clock inputs, and latch each Q output in the LOW state. If one of the clock inputs is LOW during and after a reset or load operation, the next LOW-to-HIGH transition of that clock will be interpreted as a legitimate signal and will be counted.

## Function Table

| MR | $\overline{\mathbf{P L}}$ | $\mathbf{C P}_{\mathbf{U}}$ | $\mathbf{C P}_{\mathbf{D}}$ | Mode |
| :---: | :---: | :---: | :---: | :--- |
| H | X | X | X | Reset (Asyn.) |
| L | L | X | X | Preset (Asyn.) |
| L | H | H | H | No Change |
| L | H | $\sim$ | H | Count Up |
| L | H | H | $\sim$ | Count Down |

H = HIGH Voltage Level
L = LOW Voltage Level
$\mathrm{X}=$ Immaterial
$\sim=$ LOW-to-HIGH Clock Transition

## State Diagram

## LIFE SUPPORT POLICY

FAIRCHILD'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF THE PRESIDENT OF FAIRCHILD SEMICONDUCTOR CORPORATION. As used herein:

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, and (c) whose failure to perform when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury to the user.
2. A critical component in any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.
