## Features

■ High speed, low power, first-in first-out (FIFO) memories

- $64 \times 18$ (CY7C4425)
- $256 \times 18$ (CY7C4205)
- $512 \times 18$ (CY7C4215)

■ 1K $\times 18$ (CY7C4225)

- $2 \mathrm{~K} \times 18$ (CY7C4235)

■ 4K x 18 (CY7C4245)
■ High speed 100 MHz operation (10 ns read/write cycle time)

- Low power ( $\mathrm{I}_{\mathrm{CC}}=45 \mathrm{~mA}$ )
- Fully asynchronous and simultaneous read and write operation

■ Empty, Full, Half Full, and Programmable Almost Empty/Almost Full status flags

■ TTL compatible

- Retransmit function
- Output Enable ( $\overline{\mathrm{OE}}$ ) pin
- Independent read and write enable pins

■ Center power and ground for reduced noise
■ Supports free running 50\% duty cycle clock inputs

- Width Expansion Capability
- Depth Expansion Capability
- Available in 64 pin $14 \times 14$ TQFP, 64 pin $10 \times 10$ TQFP, and 68-pin PLCC

## Functional Description

The CY7C42X5 are high speed, low power, first-in first-out (FIFO) memories with clocked read and write interfaces. All are 18 bits wide and are pin/functionally compatible to IDT722X5. The CY7C42X5 can be cascaded to increase FIFO depth. Programmable features include Almost Full/Almost Empty flags. These FIFOs provide solutions for a wide variety of data buffering needs, including high speed data acquisition, multiprocessor interfaces, and communications buffering.
These FIFOs have 18 -bit input and output ports that are controlled by separate clock and enable signals. The input port is controlled by a free-running clock (WCLK) and a write enable pin ( $\overline{\mathrm{WEN}}$ ). When $\overline{\mathrm{WEN}}$ is asserted, data is written into the FIFO on the rising edge of the WCLK signal. While WEN is held active, data is continually written into the FIFO on each cycle. The output port is controlled in a similar manner by a free-running read clock (RCLK) and a read enable pin (REN). In addition, the CY7C42X5 have an output enable pin ( $\overline{\mathrm{OE}) \text {. The read and write }}$ clocks may be tied together for single-clock operation or the two clocks may be run independently for asynchronous read/write applications. Clock frequencies up to 100 MHz are achievable.
Retransmit and Synchronous Almost Full/Almost Empty flag features are available on these devices.
Depth expansion is possible using the cascade input ( $\overline{\mathrm{WXI}}, \overline{\mathrm{RXI}})$, cascade output ( $\mathrm{WXO}, \overline{\mathrm{RXO}}$ ), and First Load (FL) pins. The $\overline{\mathrm{WXO}}$ and $\overline{\mathrm{RXO}}$ pins are connected to the $\overline{\mathrm{WXI}}$ and RXI pins of the next device, and the $\overline{\mathrm{WXO}}$ and $\overline{\mathrm{RXO}}$ pins of the last device should be connected to the $\overline{W X I}$ and $\overline{\mathrm{RXI}}$ pins of the first device. The $\overline{F L}$ pin of the first device is tied to VSS and the $\overline{F L}$ pin of all the remaining devices should be tied to VCC.
The CY7C42X5 provides five status pins. These pins are decoded to determine one of five states: Empty, Almost Empty, Half Full, Almost Full, and Full (see Table 2). The Half Full flag shares the WXO pin. This flag is valid in the standalone and width-expansion configurations. In the depth expansion, this pin provides the expansion out ( $\overline{\mathrm{WXO}}$ ) information that is used to signal the next FIFO when it will be activated.
The Empty and Full flags are synchronous, i.e., they change state relative to either the read clock (RCLK) or the write clock (WCLK). When entering or exiting the Empty states, the flag is updated exclusively by the RCLK. The flag denoting Full states is updated exclusively by WCLK. The synchronous flag architecture guarantees that the flags will remain valid from one clock cycle to the next. As mentioned previously, the Almost Empty/Almost Full flags become synchronous if the VCC/SMODE is tied to VSS. All configurations are fabricated using an advanced 0.65 m N-Well CMOS technology. Input ESD protection is greater than 2001V, and latch-up is prevented by the use of guard rings.

## Pin Definitions

| Signal Name | Description | 10 | Function |
| :---: | :---: | :---: | :---: |
| $\mathrm{D}_{0-17}$ | Data Inputs | 1 | Data inputs for an 18-bit bus. |
| $\mathrm{Q}_{0-17}$ | Data Outputs | O | Data outputs for an 18-bit bus. |
| WEN | Write Enable | 1 | Enables the WCLK input. |
| $\overline{\text { REN }}$ | Read Enable | 1 | Enables the RCLK input. |
| WCLK | Write Clock | 1 | The rising edge clocks data into the FIFO when $\overline{\mathrm{WEN}}$ is LOW and the FIFO is not Full. When $\overline{L D}$ is asserted, WCLK writes data into the programmable flag-offset register. |
| RCLK | Read Clock | 1 | The rising edge clocks data out of the FIFO when $\overline{\text { REN }}$ is LOW and the FIFO is not Empty. When LD is asserted, RCLK reads data out of the programmable flag-offset register. |
| $\overline{\mathrm{WXO}} / \overline{\mathrm{HF}}$ | Write Expansion Out/Half Full Flag | O | Dual-Mode Pin. Single device or width expansion - Half Full status flag. Cascaded - Write Expansion Out signal, connected to WXI of next device. |
| $\overline{\mathrm{EF}}$ | Empty Flag | O | When $\overline{\mathrm{EF}}$ is LOW, the FIFO is empty. $\overline{\mathrm{EF}}$ is synchronized to RCLK. |
| $\overline{\mathrm{FF}}$ | Full Flag | O | When $\overline{\mathrm{FF}}$ is LOW, the FIFO is full. $\overline{\mathrm{FF}}$ is synchronized to WCLK. |
| $\overline{\text { PAE }}$ | Programmable Almost Empty | O | When $\overline{\text { PAE }}$ is LOW, the FIFO is almost empty based on the almost empty offset value programmed into the FIFO. PAE is asynchronous when $\mathrm{V}_{\mathrm{CC}} / \overline{S M O D E}$ is tied to $\mathrm{V}_{\mathrm{Cc}}$; it is synchronized to RCLK when $\mathrm{V}_{\mathrm{CC}} /$ SMODE is tied to $\mathrm{V}_{\mathrm{SS}}$. |
| $\overline{\text { PAF }}$ | Programmable Almost Full | O | When $\overline{\text { PAF }}$ is LOW, the FIFO is almost full based on the almost full offset value programmed into the FIFO. $\overline{\text { PAF }}$ is asynchronous when $\mathrm{V}_{\mathrm{CC}} / \overline{\mathrm{SMODE}}$ is tied to $\mathrm{V}_{\mathrm{CC}}$; it is synchronized to WCLK when $\mathrm{V}_{\mathrm{CC}} / \overline{\text { SMODE }}$ is tied to $\mathrm{V}_{\mathrm{SS}}$. |
| $\overline{\text { LD }}$ | Load | 1 | When $\overline{\mathrm{LD}}$ is LOW, $\mathrm{D}_{0-17}\left(\mathrm{O}_{0-17}\right)$ are written (read) into (from) the program-mable-flag-offset register. |
| $\overline{\text { FL/RT }}$ | First Load/ Retransmit | 1 | Dual-Mode Pin. Cascaded - The first device in the daisy chain will have $\overline{F L}$ tied to $\mathrm{V}_{\mathrm{SS}}$; all other devices will have FL tied to $\mathrm{V}_{\mathrm{CC}}$. In standard mode of width expansion, FL is tied to $\mathrm{V}_{\mathrm{SS}}$ on all devices. Not Cascaded - Tied to $\mathrm{V}_{\mathrm{SS}}$. Retransmit function is also available in standalone mode by strobing RT. |
| $\overline{\mathrm{WXI}}$ | Write Expansion Input | 1 | Cascaded - Connected to $\overline{\mathrm{WXO}}$ of previous device. Not Cascaded - Tied to $\mathrm{V}_{\text {SS }}$. |
| $\overline{\mathrm{RXI}}$ | Read Expansion Input | 1 | Cascaded - Connected to $\overline{\mathrm{RXO}}$ of previous device. Not Cascaded - Tied to $\mathrm{V}_{\text {Ss }}$. |

Pin Definitions (continued)

| Signal Name | Description | IO | Function |
| :--- | :--- | :---: | :--- |
| $\overline{\mathrm{RXO}}$ | Read Expansion <br> Output | O | Cascaded - Connected to $\overline{\mathrm{RXI}}$ of next device. |
| $\overline{\mathrm{RS}}$ | Reset | I | Resets device to empty condition. A reset is required before an initial read or write <br> operation after power-up. |
| $\overline{\mathrm{OE}}$ | Output Enable | I | When $\overline{\mathrm{OE}}$ is LOW, the FIFO's data outputs drive the bus to which they are connected. <br> If $\overline{\mathrm{OE}}$ is HIGH, the FIFO's outputs are in High Z (high-impedance) state. |
| $\mathrm{V}_{\mathrm{CC}} / \overline{\mathrm{SMODE}}$ | Synchronous <br> Almost Emptyl <br> Almost Full Flags | I | Dual-Mode Pin. Asynchronous Almost Empty/Almost Full flags - tied to $\mathrm{V}_{\mathrm{cc}}$. <br> Synchronous Almost Empty/Almost Full flags - tied to $\mathrm{V}_{\text {SS }}$. (Almost Empty synchro- <br> nized to RCLK, Almost Full synchronized to WCLK.) |

## Architecture

The CY7C42X5 consists of an array of 64 to 4 K words of 18 bits each (implemented by a dual-port array of SRAM cells), a read pointer, a write pointer, control signals (RCLK, WCLK, REN, $\overline{\mathrm{WEN}}, \mathrm{RS}$ ), and flags ( $\overline{\mathrm{EF}}, \overline{\mathrm{PAE}}, \widehat{\mathrm{HF}}, \overline{\mathrm{PAF}}, \overline{\mathrm{FF}}$ ). The CY7C42X5 also includes the control signals $\mathrm{WXI}, \mathrm{RXI}, \overline{\mathrm{WXO}}, \overline{\mathrm{RXO}}$ for depth expansion.

## Resetting the FIFO

Upon power-up, the FIFO must be reset with a Reset ( $\overline{\mathrm{RS}}$ ) cycle. This causes the FIFO to enter the Empty condition signified by EF being LOW. All data outputs go LOW after the falling edge of RS only if OE is asserted. In order for the FIFO to reset to its default state, a falling edge must occur on $\overline{\mathrm{RS}}$ and the user must not read or write while RS is LOW.

## FIFO Operation

When the $\overline{W E N}$ signal is active (LOW), data present on the $D_{0-17}$ pins is written into the FIFO on each rising edge of the WCLK signal. Similarly, when the REN signal is active LOW, data in the FIFO memory will be presented on the $\mathrm{Q}_{0-17}$ outputs. New data will be presented on each rising edge of RCLK while REN is active LOW and $\overline{O E}$ is LOW. $\overline{R E N}$ must set up $t_{E N S}$ before RCLK for it to be a valid read function. WEN must occur $t_{\text {ENS }}$ before WCLK for it to be a valid write function.
An Output Enable ( $\overline{\mathrm{OE}})$ pin is provided to three-state the $\mathrm{Q}_{0-17}$ outputs when $\overline{\mathrm{OE}}$ is deasserted. When $\overline{\mathrm{OE}}$ is enabled (LOW), data in the output register will be available to the $Q_{0-17}$ outputs after $\mathrm{t}_{\mathrm{OE}}$. If devices are cascaded, the $\overline{\mathrm{OE}}$ function will only output data on the FIFO that is read enabled.
The FIFO contains overflow circuitry to disallow additional writes when the FIFO is full, and underflow circuitry to disallow additional reads when the FIFO is empty. An empty FIFO maintains the data of the last valid read on its $Q_{0-17}$ outputs even after additional reads occur.

## Programming

The CY7C42X5 devices contain two 12-bit offset registers. Data present on $D_{0-11}$ during a program write will determine the distance from Empty (Full) that the Almost Empty (Almost Full) flags become active. If the user elects not to program the FIFO's flags, the default offset values are used (see Table 2). When the Load LD pin is set LOW and WEN is set LOW, data on the inputs $D_{0-11}$ is written into the Empty offset register on the first LOW-to-HIGH transition of the write clock (WCLK). When the LD pin and WEN are held LOW then data is written into the Full offset register on the second LOW-to-HIGH transition of the Write Clock (WCLK). The third transition of the Write Clock (WCLK) again writes to the Empty offset register (see Table 1). Writing all offset registers does not have to occur at one time. One or two offset registers can be written and then, by bringing the LD pin HIGH, the FIFO is returned to normal read/write operation. When the LD pin is set LOW, and WEN is LOW, the next offset register in sequence is written.
The contents of the offset registers can be read on the output lines when the $\overline{\mathrm{LD}}$ pin is set LOW and REN is set LOW; then, data can be read on the LOW-to-HIGH transition of the Read Clock (RCLK).

Table 1. Write Offset Register

| $\overline{\text { LD }}$ | $\overline{\mathbf{W E N}}$ | WCLK $^{[1]}$ | Selection |
| :---: | :---: | :---: | :--- |
| 0 | 0 |  | Writing to offset registers: <br> Empty Offset <br> Full Offset |
| 0 | 1 |  |  |
| 1 | 0 |  | No Operation |
| 1 | 1 |  | Write Into FIFO |

Note:

1. The same selection sequence applies to reading from the registers. $\overline{\mathrm{REN}}$ is enabled and read is performed on the LOW-to-HIGH transition of RCLK.

## Flag Operation

The CY7C42X5 devices provide five flag pins to indicate the condition of the FIFO contents. Empty and Full are synchronous. $\overline{\text { PAE }}$ and PAF are synchronous if $\mathrm{V}_{C C} / \overline{\mathrm{SMODE}}$ is tied to $\mathrm{V}_{\mathrm{SS}}$.

## Full Flag

The Full Flag ( $\overline{\mathrm{FF}}$ ) will go LOW when device is Full. Write operations are inhibited whenever $\overline{\mathrm{FF}}$ is LOW regardless of the state of $\overline{W E N} . \overline{\mathrm{FF}}$ is synchronized to WCLK, i.e., it is exclusively updated by each rising edge of WCLK.

## Empty Flag

The Empty Flag ( $\overline{\mathrm{EF}}$ ) will go LOW when the device is empty. Read operations are inhibited whenever $\overline{E F}$ is LOW, regardless of the state of $\overline{R E N}$. $\overline{E F}$ is synchronized to RCLK, i.e., it is exclusively updated by each rising edge of RCLK.

## Programmable Almost EmptyIAlmost Full Flag

The CY7C42X5 features programmable Almost Empty and Almost Full Flags. Each flag can be programmed (described in the Programming section) a specific distance from the corresponding boundary flags (Empty or Full). When the FIFO contains the number of words or fewer for which the flags have been programmed, the PAF or PAE will be asserted, signifying
that the FIFO is either Almost Full or Almost Empty. See Table 2 for a description of programmable flags.
When the $\overline{\text { SMODE }}$ pin is tied LOW, the $\overline{\text { PAF }}$ flag signal transition is caused by the rising edge of the write clock and the PAE flag transition is caused by the rising edge of the read clock.

## Retransmit

The retransmit feature is beneficial when transferring packets of data. It enables the receipt of data to be acknowledged by the receiver and retransmitted if necessary.
The Retransmit (RT) input is active in the standalone and width expansion modes. The retransmit feature is intended for use when a number of writes equal to or less than the depth of the FIFO have occurred since the last $\overline{\mathrm{RS}}$ cycle. A HIGH pulse on RT resets the internal read pointer to the first physical location of the FIFO. WCLK and RCLK may be free running but must be disabled during and tRTR after the retransmit pulse. With every valid read cycle after retransmit, previously accessed data is read and the read pointer is incremented until it is equal to the write pointer. Flags are governed by the relative locations of the read and write pointers and are updated during a retransmit cycle. Data written to the FIFO after activation of RT are transmitted also.
The full depth of the FIFO can be repeatedly retransmitted.

Table 2. Flag Truth Table

| Number of Words in FIFO |  |  | FF | $\overline{\text { PAF }}$ | $\overline{\mathrm{HF}}$ | $\overline{\text { PAE }}$ | $\overline{E F}$ |

[^0]
## Width Expansion Configuration

The CY7C42X5 can be expanded in width to provide word widths greater than 18 in increments of 18. During width expansion mode all control line inputs are common and all flags are
available. Empty (Full) flags should be created by ANDing the Empty (Full) flags of every FIFO. This technique will avoid ready data from the FIFO that is "staggered" by one clock cycle due to the variations in skew between RCLK and WCLK. Figure 3 demonstrates a 36-word width by using two CY7C42X5.

Figure 3. Block Diagram of Synchronous FIFO Memories Used in a Width Expansion Configuration

## Depth Expansion Configuration (with Programmable Flags)

The CY7C42X5 can easily be adapted to applications requiring more than 64/256/512/1024/2048/4096 words of buffering. Figure 4 shows Depth Expansion using three CY7C42X5s. Maximum depth is limited only by signal loading. Follow these steps:

1. The first device must be designated by grounding the First Load ( FL ) control input.
2. All other devices must have $\overline{\mathrm{FL}}$ in the HIGH state.
3. The Write Expansion Out $(\overline{\mathrm{WXO}})$ pin of each device must be tied to the Write Expansion In (WXI) pin of the next device.
4. The Read Expansion Out $(\overline{R X O})$ pin of each device must be tied to the Read Expansion $\ln (\widehat{\mathrm{RXI}})$ pin of the next device.
5. All Load ( $\overline{\mathrm{LD}}$ ) pins are tied together.
6. The Half-Full Flag ( $\overline{\mathrm{HF})}$ ) is not available in the Depth Expansion Configuration.
7. $\overline{\mathrm{EF}}, \overline{\mathrm{FF}}, \overline{\mathrm{PAE}}$, and $\overline{\mathrm{PAF}}$ are created with composite flags by ORing together these respective flags for monitoring. The composite $\overline{\mathrm{PAE}}$ and $\overline{\mathrm{PAF}}$ flags are not precise.

| $\mathrm{C}_{\mathrm{OUT}}$ | Output Capacitance | $\mathrm{V}_{\mathrm{CC}}=5.0 \mathrm{~V}$ | 7 | pF |

## Notes

4. $\mathrm{T}_{\mathrm{A}}$ is the "instant on" case temperature.
5. See the last page of this specification for Group A subgroup testing information.
6. The Voltage on any input or I/O pin cannot exceed the power pin during power-up
7. The $V_{I H}$ and $V_{I L}$ specifications apply for all inputs except $\overline{W X I}, \overline{R X I}$. The $\bar{W} X I, \overline{R X I}$ pin is not a TTL input. It is connected to either $\overline{R X O}$, $\overline{W X O}$ of the previous device or $\mathrm{V}_{\mathrm{SS}}$.
8. Test no more than one output at a time for not more than one second.
9. Input signals switch from 0 V to 3 V with a rise/fall time less than 3 ns , clocks and clock enables switch at 20 MHz , while the data inputs switch at 10 MHz . Outputs are unloaded.
10. All input signals are connected to Vcc. All outputs are unloaded.
11. Tested initially and after any design or process changes that may affect these parameters.

Figure 5. AC Test Loads and Waveforms ${ }^{[13,14]}$

Figure 7. Read Cycle Timing

Figure 8. Reset Timing ${ }^{[20]}$

[^3]Switching Waveforms (continued)
Figure 9. First Data Word Latency after Reset with Simultaneous Read and Write

Figure 10. Empty Flag Timing

## Notes:

22. When $\mathrm{t}_{\text {SKEW }} \geq$ minimum specification, $\mathrm{t}_{\text {RRL }}$ (maximum) $=\mathrm{t}_{\text {CLK }}+\mathrm{t}_{\text {SKEW2 }}$. When $\mathrm{t}_{\text {SKEW } 2}<$ minimum specification, $\mathrm{t}_{\text {FRL }}$ (maximum) $=$ either $2^{* t_{C L K}}+\mathrm{t}_{\text {SKEW2 }}$ or $\mathrm{t}_{\mathrm{CLK}}+$ $\mathrm{t}_{\text {SKEW2 }}$. The Latency Timing applies only at the Empty Boundary (EF=LOW).
23. The first word is available the cycle after $\overline{\mathrm{EF}}$ goes HIGH, always.

Switching Waveforms (continued)
Figure 13. Programmable Almost Empty Flag Timing

Figure 14. Programmable Almost Empty Flag Timing (applies only in $\overline{\text { SMODE }}$ (SMODE is LOW)

## Notes:

24. PAE offset -n . Number of data words into FIFO already $=\mathrm{n}$.
25. PAE offset - n .
26. $\mathrm{t}_{\text {SKEW3 }}$ is the minimum time between a rising WCLK and a rising RCLK edge for $\overline{\text { PAE }}$ to change state during that clock cycle. If the time between the edge of WCLK and the rising RCLK is less than $\mathrm{t}_{\text {SKEW }}$, then PAE may not change state until the next RCLK.
27. If a read is performed on this rising edge of the read clock, there will be Empty + $(\mathrm{n}-1)$ words in the FIFO when PAE goes LOW.

CY7C4225/4235/4245

Switching Waveforms (continued)
Figure 15. Programmable Almost Full Flag Timing

Figure 16. Programmable Almost Full Flag Timing (applies only in SMODE (SMODE in LOW))

## Notes:

28. PAF offset $=m$. Number of data words written into FIFO already $=64-m+1$ for the CY7C4425, $256-m+1$ for the CY7C4205, $512-m+1$ for the CY7C4215. 1024 $-m+1$ for the CY7C4225, $2048-m+1$ for the CY7C4235, and $4096-m+1$ for the CY7C4245
29. PAF is offset $=\mathrm{m}$.
30. 64 - m words in CY7C4425, 256 - m words in CY7C4205, 512 - m words in CY7C4215. 1024 - m words in CY7C4225, 2048-m words in CY7C4235, and 4096-m words in CY7C4245.
$31.64-m+1$ words in CY7C4425, $256-m+1$ words in CY7C4205, $512-m+1$ words in CY7C4215, $1024-m+1$ CY7C4225, $2048-m+1$ in CY7C4235, and 4096 $-m+1$ words in CY7C4245.
31. If a write is performed on this rising edge of the write clock, there will be Full - ( $m-1$ ) words of the FIFO when PAF goes LOW.
32. PAF offset $=\mathrm{m}$.
33. $\mathrm{t}_{\text {SKEW3 }}$ is the minimum time between a rising RCLK and a rising WCLK edge for PAF to change state during that clock cycle. If the time between the edge of RCLK and the rising edge of WCLK is less than $\mathrm{t}_{\text {SKEW3 }}$, then PAF may not change state until the next WCLK rising edge.

[^5]
[^0]:    Note
    2. $n=$ Empty Offset (Default Values: CY7C4425 $n=7$, CY7C4205 $n=31$, CY7C4215 $n=63$, CY7C4225/CY7C4235/CY7C4245 $n=127$ ).
    3. $m=$ Full Offset (Default Values: CY7C4425 $n=7$, CY7C4205 $n=31, C Y 7 C 4215 n=63, C Y 7 C 4225 / C Y 7 C 4235 / C Y 7 C 4245 n=127$ ).

[^1]:    Notes
    13. $\mathrm{C}_{\mathrm{L}}=30 \mathrm{pF}$ for all AC parameters except for $\mathrm{t}_{\mathrm{OHz}}$.
    14. $\mathrm{C}_{\mathrm{L}}=5 \mathrm{pF}$ for $\mathrm{t}_{\mathrm{OHz}}$.
    15. Pulse widths less than minimum values are not allowed.
    16. Values guaranteed by design, not currently tested.
    17. $t_{\text {PAFasynch }}$, $t_{\text {PAEasynch }}$, after program register write will not be valid until $5 \mathrm{~ns}+t_{\text {PAF(E) }}$.

[^2]:    Note
    18. $\mathrm{t}_{\text {SKEW1 }}$ is the minimum time between a rising RCLK edge and a rising WCLK edge to guarantee that $\overline{\mathrm{FF}}$ will go HIGH during the current clock cycle. If the time between the rising edge of RCLK and the rising edge of WCLK is less than $t_{\text {SKEW1 }}$, then FF may not change state until the next WCLK edge.

[^3]:    Notes:
    19. $\mathrm{t}_{\text {SKEW2 }}$ is the minimum time between a rising WCLK edge and a rising RCLK edge to guarantee that $\overline{\mathrm{EF}}$ will go HIGH during the current clock cycle. It the time between the rising edge of WCLK and the rising edge of RCLK is less than $t_{\text {SKEW2 }}$, then EF may not change state until the next RCLK edge.
    20. The clocks (RCLK, WCLK) can be free-running during reset.
    21. After reset, the outputs will be LOW if $\overline{\mathrm{OE}}=0$ and three-state if $\overline{\mathrm{OE}}=1$.

[^4]:    Notes:
    36. Read from Last Physical Location.
    37. Clocks are free running in this case
    38. The flags may change state during Retransmit as a result of the offset of the read and write pointers, but flags will be valid at $t_{\text {RTR }}$.
    39. For the synchronous PAE and PAF flags (SMODE), an appropriate clock cycle is necessary after $t_{\text {RTR }}$ to update these flags.
