DESCRIPTION

The M74HC373 is an high speed CMOS OCTAL LATCH WITH 3-STATE OUTPUTS fabricated with sub-micron silicon gate C^2MOS technology.
This 8-BIT D-Type latches is controlled by a latch enable input (LE) and output enable input ($\overline{OE}$).
While the LE input is held at a high level, the Q outputs will follow the data input. When the LE is taken low, the Q outputs will be latched at the logic level of D input data.

While the $\overline{OE}$ input is at low level, the eight outputs will be in a normal logic state (high or low logic level) and when $\overline{OE}$ is in high level the outputs will be in a high impedance state.
The 3-State output configuration and the wide choice of outline make bus organized system simple.
All inputs are equipped with protection circuits against static discharge and transient excess voltage.

1) C_{PD} is defined as the value of the IC's internal equivalent capacitance which is calculated from the operating current consumption without load. (Refer to Test Circuit). Average operating current can be obtained by the following equation. $I_{CC(opr)} = C_{PD} \times V_{CC} \times f_{IN} + I_{CC}/8$ (per Flip Flop) and the C_{PD} when n pcs of Flip Flop operate, can be gained by the following equation: $C_{PD(TOTAL)} = 22 + 16 \times n$ (pF)
