SN74LV8153-Q1
SERIAL-TO-PARALLEL INTERFACE

SCLS591A − SEPTEMBER 2004 − REVISED APRIL 2008

DESCRIPTION

The SN74LV8153 is a serial-to-parallel data converter. It accepts serial input data and outputs 8-bit parallel data.

The automatic data-rate detection feature of the SN74LV8153 eliminates the need for an external oscillator and helps with cost and board real-estate savings.

The OUTSEL pin is used to choose between open collector and push-pull outputs. The open-collector option is suitable when this device is used in applications such as LED interface, where high drive current is required. SOUT is the output that acknowledges reception of the serial data.

To ensure the high-impedance state during power up or power down, $\overline{OE}$ should be tied to V_{CC1} through a pullup resistor; the minimum value of the resistor is determined by the current-sinking capability of the driver.

FEATURES

- **Qualified for Automotive Applications**
- **Single-Wire Serial Data Input**
- **Compatible With UART Serial-Data Format**
- **Up to Eight Devices (64-Bit Parallel) Can Share the Same Bus by Using Different Combinations of A0, A1, A2**
- **Up to 40 mA Current Drive in Open-Collector Mode for Driving LEDs**
- **Outputs Can be Configured as Open-Collector or Push-Pull**
- **Internal Oscillator and Counter for Automatic Data-Rate Detection**
- **Output Levels Are Referenced to V_{CC2} and Can Be Configured From 3 V to 12 V**
- **Latch-Up Performance Exceeds 250 mA Per JESD 17**
- **ESD Protection Exceeds JESD 22**
  - **2000-V Human-Body Model (A114-A)**
  - **1000-V Charged-Device Model (C101)**

SUMMARY OF RECOMMENDED OPERATING CONDITIONS

PARAMETER	
V_{CC1}	3 V to 5.5 V
V_{CC2}	3 V to 13.2 V
I_{OL}	40 mA @ V_{CC2} = 4.5 V (open-collector mode)
I_{OH}	−24 mA @ V_{CC2} = 12 V (push-pull mode)
Maximum Data Rate	24 Kbps

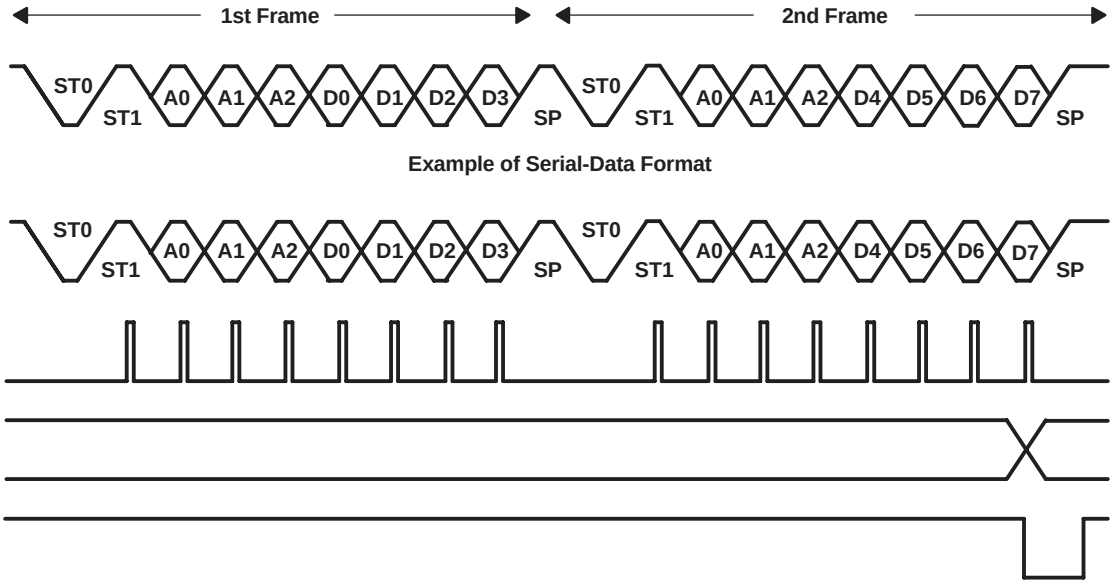
PIN DESCRIPTION

PIN #	PIN NAME	I/O	PIN FUNCTION
1	V_{CC1}		Power-supply pin (all inputs and outputs except for Y0-Y7)
2-4	A0, A1, A2	In	The address pins are used to program the address of the device and allow up to eight devices to share the same bus.
5	D	In	Serial data input
6	OUTSEL	In	Choose between open-collector and push-pull type outputs (Y0-Y7).
7	$\overline{\text{RESET}}$	In	Initialize register status
8	$\overline{\text{OE}}$	In	Force Y0-Y7 to Hi-Z
9	SOUT	Out	Outputs a pulse when latch data is changed. Supplied by V_{CC1}.
12-19	Y0-Y7	Out	Push-pull or open collector parallel data outputs. Supplied by V_{CC2}.
20	V_{CC2}		Power-supply pin for outputs (Y0-Y7). V_{CC2} can range from 3 V to 13.2 V.

data transmission protocol

- The serial data should be sent as 2START-3ADDRESS-4DATA-1STOP. Two consecutive serial-data frames transmit 8 bits of data. The first frame includes the lower four bits of data (D0-D3), and the second frame includes the upper four bits (D4-D7).
- The three address bits (in the consecutive frame) must be the same as those in the first frame; otherwise, the data will be dropped.
- The order of the two start bits must be 0, then 1 in any frame; otherwise, the data rate will not be detected correctly. The period between the falling edge of the first start bit (ST0) and the rising edge of the second start bit (ST1) is measured to generate an internal-clock synchronized data stream.



Example of Serial-Data Format

Timing Chart

(1) Internal clock cannot be observed.
(1) D0 is LSB and D7 is MSB. The data stream should be LSB first.

(1) Stresses beyond those listed under “absolute maximum ratings” may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under “recommended operating conditions” is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
(2) The input and output voltage ratings may be exceeded if the input and output current ratings are observed.
(3) The value of V_{CC} is provided in the recommended operating condition table.
(4) The package thermal impedance is calculated in accordance with JESD 51-7.

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check http://www.ti.com/productcontent for the latest availability information and additional product content details.
TBD: The Pb-Free/Green conversion plan has not been defined.
Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.
Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.
Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.
