DESCRIPTION

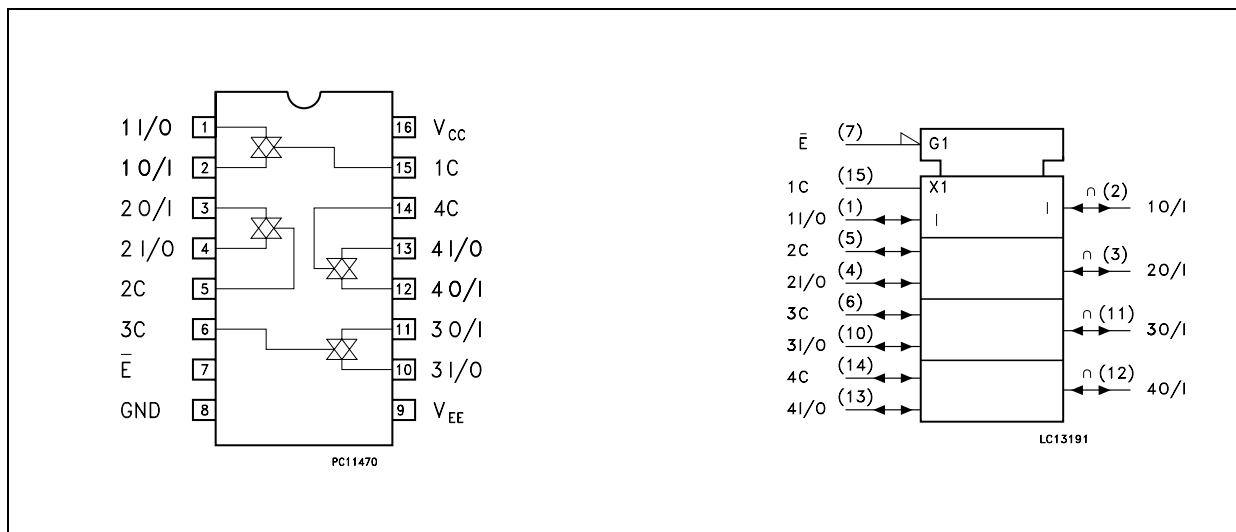

The M74HC4316 is an high speed CMOS QUAD BILATERAL SWITCH fabricated with silicon gate C²MOS technology.

This device has four independent analogue switches. Each switch has two input/output terminals (nI/O, nO/I) and an active high select input (nC).

When the enable input is high, all four analog switches are off. The supply voltage for the digital signals applied to V_{CC} and GND must be within the range 0 to 6 V. The voltage swing on the analogue Inputs/Outputs can be between V_{CC} (positive limit) and V_{EE} (negative limit). The voltage between V_{CC} and V_{EE} must not exceed 12V.

All inputs are equipped with protection circuits against static discharge and transient excess voltage.
