## DESCRIPTION

The 74LVQ4066 is a low voltage CMOS QUAD BILATERAL SWITCH fabricated with sub-micron silicon gate and double-layer metal wiring $\mathrm{C}^{2} \mathrm{MOS}$ technology.
It is ideal for low power and low noise 3.3 V applications and each switch is designed to handle both analog and digital signals.
The switches permit signals with amplitudes up to $\mathrm{V}_{\mathrm{CC}}$ (peak) to be transmitted in either direction

without relevant propagation delay and without generating additional ground bounce noise.
It has an ON-Resistance which is greatly reduced in comparison with 74 HC 4066.
It is provided of four individual enable inputs to control the switches; the switch is ON when the C input is held high and OFF (High Impedance) when C is held low.
All inputs and outputs are equipped with protection circuits against static discharge, giving them ESD immunity and transient excess voltage.
