SN74GTLPH1627 18-BIT LVTTL-TO-GTLP BUS TRANSCEIVER WITH SOURCE-SYNCHRONOUS CLOCK OUTPUTS

SCES356C-JUNE 2001-REVISED DECEMBER 2005

FEATURES

- Member of the Texas Instruments Widebus™
 Family
- TI-OPC™ Circuitry Limits Ringing on Unevenly Loaded Backplanes
- OEC[™] Circuitry Improves Signal Integrity and Reduces Electromagnetic Interference
- Bidirectional Interface Between GTLP Signal Levels and LVTTL Logic Levels
- GTLP Buffered SYSCLK Signal (SSCLK) for Source-Synchronous Applications
- LVTTL Interfaces Are 5-V Tolerant
- High-Drive GTLP Outputs (100 mA)
- LVTTL Outputs (-24 mA/24 mA)
- GTLP Rise and Fall Times Designed for Optimal Data-Transfer Rate and Signal Integrity in Distributed Loads
- I_{off}, Power-Up 3-State, and BIAS V_{CC} Support Live Insertion
- Bus Hold on A-Port Data Inputs
- Distributed V_{CC} and GND Pins Minimize High-Speed Switching Noise
- Latch-Up Performance Exceeds 100 mA Per JESD 78, Class II
- ESD Protection Exceeds JESD 22
 - 2000-V Human-Body Model (A114-A)
 - 200-V Machine Model (A115-A)
 - 1000-V Charged-Device Model (C101)

SCES356C-JUNE 2001-REVISED DECEMBER 2005

DESCRIPTION/ORDERING INFORMATION (CONTINUED)

The SN74GTLPH1627 is a high-drive, 18-bit bus transceiver that provides LVTTL-to-GTLP and GTLP-to-LVTTL signal-level translation. The device allows for transparent and latched modes of data transfer. Additionally, with the use of the clock-mode select (CMS) input, the device can be used in source-synchronous and clock-synchronous applications. Source-synchronous applications require the skew between the clock output and data output to be minimized for optimum maximum-frequency system performance. In order to reduce this skew, a flexible setup time adjustment (FSTA) feature is incorporated into the device that sets a predetermined delay between the clock and data. The CMS and direction (DIR) inputs control the mode of the device. The system clock (SYSCLK) and CLKOUT pins are LVTTL compatible, while the source synchronous I/O is GTLP compatible. The benefits include compensation for output-to-output skew coming from the driver itself, and compensation for process skew if more than one driver is used. The device provides a high-speed interface between cards operating at LVTTL logic levels and a backplane operating at GTLP signal levels. High-speed (about three times faster than standard TTL or LVTTL) backplane operation is a direct result of GTLP's reduced output swing (<1 V), reduced input threshold levels, improved differential input, OEC™ circuitry, and TI-OPC™ circuitry. Improved GTLP OEC and TI-OPC circuits minimize bus-settling time and have been designed and tested using several backplane models. The high drive allows incident-wave switching in heavily loaded backplanes, with equivalent load impedance down to 11 Ω .

GTLP is the Texas Instruments derivative of the Gunning Transceiver Logic (GTL) JEDEC standard JESD 8-3. The ac specification for the SN74GTLPH1627 is given only at the preferred higher noise-margin GTLP, but the user has the flexibility of using this device at either GTL ($V_{TT} = 1.2 \text{ V}$ and $V_{REF} = 0.8 \text{ V}$) or GTLP ($V_{TT} = 1.5 \text{ V}$ and $V_{REF} = 1 \text{ V}$) signal levels. For information on using GTLP devices in FB+/BTL applications, refer to TI application reports, Texas Instruments GTLP Frequently Asked Questions, literature number SCEA019, and GTLP in BTL Applications, literature number SCEA017.

Normally, the B port operates at GTLP signal levels. The A-port and control inputs operate at LVTTL logic levels, but are 5-V tolerant and are compatible with TTL and 5-V CMOS inputs. V_{REF} is the B-port differential input reference voltage.

This device is fully specified for live-insertion applications using $I_{\rm off}$, power-up 3-state, and BIAS $V_{\rm CC}$. The $I_{\rm off}$ circuitry disables the outputs, preventing damaging current backflow through the device when it is powered down. The power-up 3-state circuitry places the outputs in the high-impedance state during power up and power down, which prevents driver conflict. The BIAS $V_{\rm CC}$ circuitry precharges and preconditions the B-port input/output connections, preventing disturbance of active data on the backplane during card insertion or removal, and permits true live-insertion capability.

This GTLP device features TI-OPC circuitry, which actively limits the overshoot caused by improperly terminated backplanes, unevenly distributed cards, or empty slots during low-to-high signal transitions. This improves signal integrity, which allows adequate noise margin to be maintained at higher frequencies.

High-drive GTLP backplane interface devices feature adjustable edge-rate control (ERC). Changing the ERC input voltage between low and high adjusts the B-port output rise and fall times. This allows the designer to optimize system data-transfer rate and signal integrity to the backplane load.

Active bus-hold circuitry holds unused or undriven LVTTL data inputs at a valid logic state. Use of pullup or pulldown resistors with the bus-hold circuitry is not recommended.

When V_{CC} is between 0 and 1.5 V, the device is in the high-impedance state during power up or power down. However, to ensure the high-impedance state above 1.5 V, the output-enable (\overline{OE}) input should be tied to V_{CC} through a pullup resistor; the minimum value of the resistor is determined by the current-sinking capability of the driver.

SCES356C-JUNE 2001-REVISED DECEMBER 2005

FUNCTIONAL DESCRIPTION

The SN74GTLPH1627 is a high-drive (100 mA), 18-bit bus transceiver containing D-type latches and D-type flip-flops for data-path operation in transparent or latched modes and can replace any of the functions shown in Table 1. Data polarity is noninverting.

Table 1. SN74GTLPH1627 Bus Transceiver Replacement Functions

FUNCTION	8 BIT	9 BIT 10 BIT		16 BIT	18 BIT						
Transceiver	'245, '623, '645	'863	'861	'16245, '16623	'16863						
Buffer/driver	'241, '244, '541		'827	'16241, '16244, '16541	'16825						
Latched transceiver	'543			'16543	'16472						
Latch	'373, '573	'843	'841	'16373	'16843						
	SN74GTLPH1627 bus transceiver replaces all above functions.										

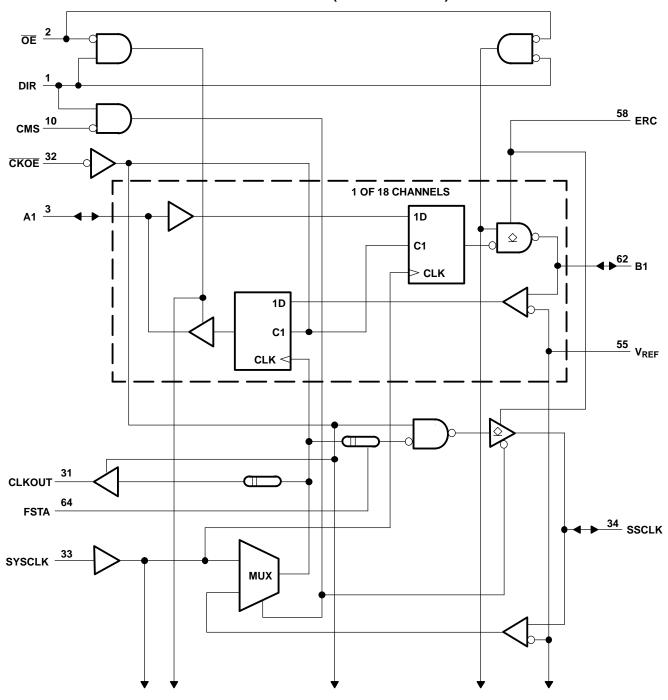

Additionally, the device allows for conversion of the system clock (SYSCLK) to GTLP signal levels (SSCLK) and LVTTL signal levels (CLKOUT). It also provides conversion of a GTLP source-synchronous clock to LVTTL signal levels (CLKOUT).

The device allows for conversion of the LVTTL system clock (SYSCLK) to GTLP (SSCLK) and LVTTL (CLKOUT) signal levels when used as the transmitter, and GTLP source-synchronous clock (SSCLK) to LVTTL (CLKOUT) signal levels when used as the receiver in source-synchronous applications. Source-synchronous operation removes time-of-flight restrictions and allows for increased data throughput. CMS is used to switch between system-synchronous mode and clock-synchronous mode. The clock output-enable (CKOE) input is used to switch between latched and transparent mode.

Data flow in each direction is controlled by $\overline{\text{CKOE}}$, clock (SYSCLK or SSCLK), direction (DIR), and $\overline{\text{OE}}$. $\overline{\text{OE}}$ controls the 18 bits of data. The CLKOUT/SSCLK buffered clock path for the A-to-B and B-to-A directions is controlled by $\overline{\text{CKOE}}$. In the data isolation mode ($\overline{\text{OE}}$ high, $\overline{\text{CKOE}}$ low), A data may be stored in one register and/or B data may be stored in the other register.

SCES356C-JUNE 2001-REVISED DECEMBER 2005

Absolute Maximum Ratings⁽¹⁾

over operating free-air temperature range (unless otherwise noted)

			MIN	MAX	UNIT
V _{CC} BIAS V _{CC}	Supply voltage range		-0.5	4.6	V
M	Input voltage range ⁽²⁾	A-port and control inputs	-0.5	7	V
VI	input voltage range	B port and V _{REF}	-0.5	4.6	V
M	Voltage range applied to any output	A port	-0.5	7	V
	in the high-impedance or power-off state (2)	B port	-0.5	4.6	V
	Company into any output in the law state	A port		48	
Io	Current into any output in the low state	B port		200	mA
Io	Current into any A-port output in the high state (3)			48	mA
	Continuous current through each V _{CC} or GND			±100	mA
I _{IK}	Input clamp current	V _I < 0		-50	mA
I _{OK}	Output clamp current	V _O < 0		-50	mA
θ_{JA}	Package thermal impedance ⁽⁴⁾			55	°C/W
T _{stg}	Storage temperature range				°C

⁽¹⁾ Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

The input and output negative-voltage ratings may be exceeded if the input and output clamp-current ratings are observed.

(3) This current flows only when the output is in the high state and V_O > V_{CC}.
 (4) The package thermal impedance is calculated in accordance with JESD 51-7.

T _A	Operating free-air temperature		-40		85	°C	

- All unused inputs of the device must be held at V_{CC} or GND to ensure proper device operation. Refer to the TI application report, Implications of Slow or Floating CMOS Inputs, literature number SCBA004.
- Proper connection sequence for use of the B-port I/O precharge feature is GND and BIAS $V_{CC} = 3.3 \text{ V}$ first, I/O second, and $V_{CC} = 3.3 \text{ V}$ last, because the BIAS V_{CC} precharge circuitry is disabled when any V_{CC} pin is connected. The control and V_{REF} inputs can be connected anytime, but normally are connected during the I/O stage. If B-port precharge is not required, any connection sequence is acceptable but, generally, GND is connected first.
- V_{TT} and R_{TT} can be adjusted to accommodate backplane impedances if the dc-recommended I_{OL} ratings are not exceeded. V_{REF} can be adjusted to optimize noise margins, but normally is two-thirds V_{TT} . TI-OPC circuitry is enabled in the A-to-B direction and is activated when $V_{TT} > 0.7 \text{ V}$ above V_{REF} . If operated in the A-to-B direction, V_{REF} should be set to within 0.6 V of V_{TT} to minimize current

SCES356C-JUNE 2001-REVISED DECEMBER 2005

- All typical values are at V_{CC} = 3.3 V, T_A = 25°C. For I/O ports, the parameter I_I includes the off-state output leakage current. The bus-hold circuit can sink at least the minimum low sustaining current at V_{IL} max. I_{BHL} should be measured after lowering V_{IN} to GND and then raising it to V_{IL} max. The bus-hold circuit can source at least the minimum high sustaining current at V_{IH} min. I_{BHH} should be measured after raising V_{IN} to
- V_{CC} and then lowering it to V_{IH} min.
- An external driver must source at least I_{BHLO} to switch this node from low to high.
- An external driver must sink at least I_{BHHO} to switch this node from high to low. This is the increase in supply current for each input that is at the specified TTL voltage level, rather than V_{CC} or GND.

⁽¹⁾ Actual skew values between the GTLP outputs could vary on the backplane due to the loading and impedance seen by the device.

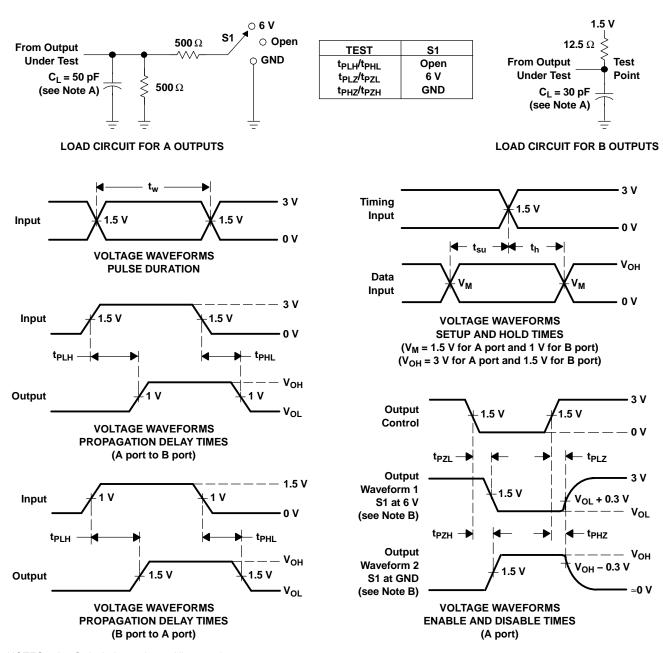

⁽²⁾ Slow (ERC = H) and Fast (ERC = L)

⁽³⁾ $t_{sk(LH)}/t_{sk(HL)}$ and $t_{sk(t)}$ — Output-to-output skew is defined as the absolute value of the difference between the actual propagation delay for all outputs with the same packaged device. The specifications are given for specific worst-case V_{CC} and temperature. The specifications apply to any outputs switching in the same direction, either high to low $[t_{sk(HL)}]$, low to high $[t_{sk(LH)}]$, or in opposite directions, both low to high and high to low $[t_{sk(t)}]$.

⁽⁴⁾ t_{sk(prLH)} or t_{sk(prLH)} – Part-to-part skew is designed as the absolute value of the difference between the actual propagation delay for all outputs from device to device. The parameter is specified for a specific worst-case V_{CC} and temperature. Furthermore, these values are provided by TI SPICE simulations.

PARAMETER MEASUREMENT INFORMATION

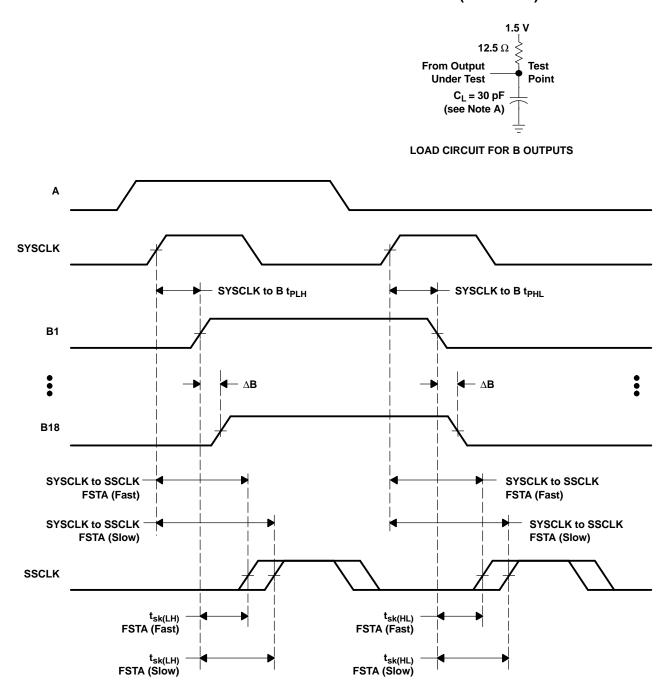

NOTES: A. C_L includes probe and jig capacitance.

- B. Waveform 1 is for an output with internal conditions such that the output is low, except when disabled by the output control. Waveform 2 is for an output with internal conditions such that the output is high, except when disabled by the output control.
- C. All input pulses are supplied by generators having the following characteristics: PRR \leq 10 MHz, $Z_O = 50 \Omega$, $t_r \leq 2$ ns, $t_f \leq 2$ ns.
- D. The outputs are measured one at a time, with one transition per measurement.
- E. Load circuit for A outputs also is used for CLKOUT; load circuit for B outputs also is used for SSCLK.

Figure 1. Load Circuits and Voltage Waveforms

SCES356C-JUNE 2001-REVISED DECEMBER 2005

PARAMETER MEASUREMENT INFORMATION (continued)

NOTES: A. C_L includes probe and jig capacitance.

- B. All input pulses are supplied by generators having the following characteristics: PRR \leq 10 MHz, Z_O = 50 Ω , $t_r \leq$ 2 ns.
- C. The outputs are measured one at a time, with one transition per measurement.
- D. Load circuit for B outputs also is used for SSCLK.

DISTRIBUTED-LOAD BACKPLANE SWITCHING CHARACTERISTICS

The preceding switching characteristics table shows the switching characteristics of the device into a lumped load (Figure 1). However, the designer's backplane application probably is a distributed load. The physical representation is shown in Figure 3. This backplane, or distributed load, can be closely approximated to a resistor inductance capacitance (RLC) circuit, as shown in Figure 4. This device has been designed for optimum performance in this RLC circuit. The following switching characteristics table shows the switching characteristics of the device into the RLC load, to help the designer to better understand the performance of the GTLP device in this typical backplane. See www.ti.com/sc/gtlp for more information.

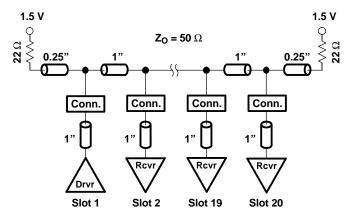

Figure 3. High-Drive Test Backplane

⁽¹⁾ The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check http://www.ti.com/productcontent for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

TAPE AND REEL INFORMATION

A0	Dimension designed to accommodate the component width
B0	Dimension designed to accommodate the component length
K0	Dimension designed to accommodate the component thickness
W	Overall width of the carrier tape
P1	Pitch between successive cavity centers

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
