

## TRIPLE IGBT/MOS DRIVER WITH CURRENT SENSE

- THREE POWER IGBT/MOS AND PULSE TRANSFORMER DRIVERS
- CURRENT SENSE COMPARATOR
- UNCOMMITTED OP-AMP
- 0.6 A PER CHANNEL PEAK OUTPUT CURRENT CAPABILITY
- LOW OUTPUT IMPEDANCE TYP: 7Ω AT 200mA
- CMOS/LSTTL COMPATIBLE INVERTING INPUT WITH HYSTERESIS
- 4V TO 16V SINGLE SUPPLY OPERATION
- LOW BIAS CURRENT TYP: 1.5mA
- ADJUSTABLE UNDERVOLTAGE LOCKOUT LEVEL
- STAND-BY MODE
- CHANNEL PARALLELING CAPABILITY

### DESCRIPTION

The TD310 is designed to drive one, two or three Power IGBT/MOS and has driving capability for pulse transformer. So it is perfectly suited to interface control IC with Power Switches in low side or half-bridge configuration.

TD310 includes a current sense comparator which inhibit the output drivers in case of overcurrent. An alarm output signals the even to a controller.

TD310 also includes an uncommitted op-amp which can be used for current measurement (as an amplifier before the A/D input of a microcontroller) or for other general purpose.

Programmable undervoltage lockout and standby mode make TD310 suitable for a large area of environment and application.

Typical applications are low side IGBT and power MOSFET drive in three phase systems, pulse transformer drive, and general purpose pulse drive.

### ORDER CODE

Part Number	Temperature Range	Package	
		N	D
TD310I	-40°C, +125°C	•	•

N = Dual in Line Package (DIP)  
D = Small Outline Package (SO) - also available in Tape & Reel (DT)

### PIN CONNECTIONS (top view)

$T_{amb}$	Operating Ambient Temperature	-40 to 125	°C

OPERATING CONDITIONS

Symbol	Parameter	Value	Unit
$V_{CC}$	Supply Voltage	4 to 16	V

INSTRUCTION FOR USE

- 1 - The TD310 supply voltage must be decoupled with a 1 $\mu$ F min. capacitor.
- 2 - If the application involving TD310 requires maximum output current capability, this current must be pulsed: pulse width 1 $\mu$ sec, duty cycle 1% at  $T_{amb}$ .

**ELECTRICAL CHARACTERISTICS** $V_{CC} = 15V$ ,  $T_{amb} = 25^{\circ}C$  (unless otherwise specified)

$V_{st1}$	Internal Stop Threshold (without external adjustment)	10.7		13.3	V
$V_{hys}$	Threshold Hysteresis		0.8		V

**UVLO/stdby pin functioning modes**

Due to the wide supply voltage range of the TD310, the UVLO function (Under Voltage Lock Out) is externally adjustable by a resistor bridge.

The bridge rate can be calculated in relation with the expected UVLO protection level as follows :

$$V_{UVLO} \times \frac{R1}{R1 + R2} = 1.2V \text{ (where R1 is the lower resistor of the bridge)}$$

The internal resistor sets the default UVLO value to 12V (\*) and might influence the external bridge rate if the values of the external resistors are too high. Moreover, the internal resistor ratio is accurate, but the tolerance on the absolute value of each internal resistor (typically 140k and 1.26M) is about +/-20%. If an external bridge is used, we recommend to choose resistor values not greater than 10k.

The standby threshold value depends of the UVLO value as follows:

$$V_{stdby} = 0.7/1.2 V_{UVLO}$$

Both UVLO and stdby functions can be inhibited by connecting the UVLO/stdby pin to  $V_{CC}^+$  via a pull up resistor (ex 150kΩ).

The following table summarizes the functions of the TD310 :

	Pin	16	9/11	5	2/3/4	15/14/13	6	7/8/10	Con- sumption
	Config	UVLO/ stdby	Sense+/ Sense-	Enable	In A/B/C	Out A/B/C	Alarm	Op-Amp	
Normal	1	H	+ > -	X	X	L	L	OK	H (1.5mA)
			+ < -	H	IN	$\overline{IN}$	H		
				L	X	L			
Stdby	2	L	+ > -	X	X	L	L	HZ	L (30μA)
			+ < -				H		
UVLO	3	M	X	X	X	L	L	OK	H

**Configuration 1 : UVLO/stdby = H**

The TD310 is in a normal consumption state (1.5mA), the operational amplifier is normally functioning and the buffer outputs are determined by the sense comparator inputs, the enable inputs and the buffer inputs.

**Configuration 2 : UVLO/stdby = L**

The TD310 is in a low consumption state (standby mode 30μA), the buffer outputs are set to low state and the operational amplifier is in high impedance state.

**Configuration 3 : UVLO/stdby = M**

The VCC supply voltage is between  $V_{UVLO}$  and  $V_{stdby}$  (\*\*). The TD310 remains in a normal consumption state and the operational amplifier is normally functioning but the buffer outputs and the alarm pin are set to low state.

(\*) If the UVLO level remains unadjusted, it is recommended to bypass the UVLO/stdby pin with a 1nF capacitor.

(\*\*) If the supply voltage falls below  $V_{stdby}$ , the TD310 is set in standby mode (configuration 2).
