

1 Mbit (64K x16) 3.0V Asynchronous SRAM

FEATURES SUMMARY

- SUPPLY VOLTAGE: 2.7 to 3.6V
- 64K x 16 bits SRAM with OUTPUT ENABLE
- EQUAL CYCLE and ACCESS TIME: 55ns and 70ns
- LOW STANDBY CURRENT
- LOW V_{CC} DATA RETENTION: 2.0V
- TRI-STATE COMMON I/O
- AUTOMATIC POWER DOWN

SUMMARY DESCRIPTION

The M68AW064F is a 1 Mbit (1,048,576 bit) CMOS SRAM, organized as 65,536 words by 16 bits. The device features fully static operation requiring no external clocks or timing strobes, with equal address access and cycle times. It requires a single 2.7 to 3.6V supply. This device has an au-

tomatic power-down feature, reducing the power consumption by over 99% when deselected.

The M68AW064F is available in TFBGA48 (0.75 mm pitch) package.

MAXIMUM RATING

Stressing the device above the rating listed in the Absolute Maximum Ratings" table may cause permanent damage to the device. These are stress ratings only and operation of the device at these or any other conditions above those indicated in the Operating sections of this specification is not im-

plied. Exposure to Absolute Maximum Rating conditions for extended periods may affect device reliability. Refer also to the STMicroelectronics SURE Program and other relevant quality documents.

Note: 1. One output at a time, not to exceed 1 second duration.
2. Up to a maximum operating V_{CC} of 3.6V only.

DC AND AC PARAMETERS

This section summarizes the operating and measurement conditions, as well as the DC and AC characteristics of the device. The parameters in the following DC and AC Characteristic tables are derived from tests performed under the Measure-

ment Conditions listed in the relevant tables. Designers should check that the operating conditions in their projects match the measurement conditions when using the quoted parameters.

OPERATION

The M68AW064F has a Chip Enable power down feature which invokes an automatic standby mode whenever either $\overline{\text{CE}}$ is de-asserted ($\overline{\text{CE}} = \text{High}$) or $\overline{\text{LB}}$ and $\overline{\text{UB}}$ are de-asserted ($\overline{\text{LB}}$ and $\overline{\text{UB}} = \text{High}$). An Output Enable ($\overline{\text{OE}}$) signal provides

a high speed tri-state control, allowing fast read/write cycles to be achieved with the common I/O data bus. Operational modes are determined by device control inputs $\overline{\text{W}}$, $\overline{\text{E}}$, $\overline{\text{LB}}$ and $\overline{\text{UB}}$ as summarized in the Operating Modes table (see Table 6).

Table 6. Operating Modes

Operation	$\overline{\text{E}}$	$\overline{\text{W}}$	$\overline{\text{G}}$	$\overline{\text{LB}}$	$\overline{\text{UB}}$	DQ0-DQ7	DQ8-DQ15	Power

Note: 1. X = V_{IH} or V_{IL} .

Read Mode

The M68AW064F is in the Read mode whenever Write Enable ($\overline{\text{W}}$) is High with Output Enable ($\overline{\text{G}}$) Low, and Chip Enable ($\overline{\text{E}}$) is asserted. This provides access to data from eight or sixteen, depending on the status of the signal $\overline{\text{UB}}$ and $\overline{\text{LB}}$, of the 1,048,576 locations in the static memory array, specified by the 16 address inputs. Valid data will be available at the eight or sixteen output pins

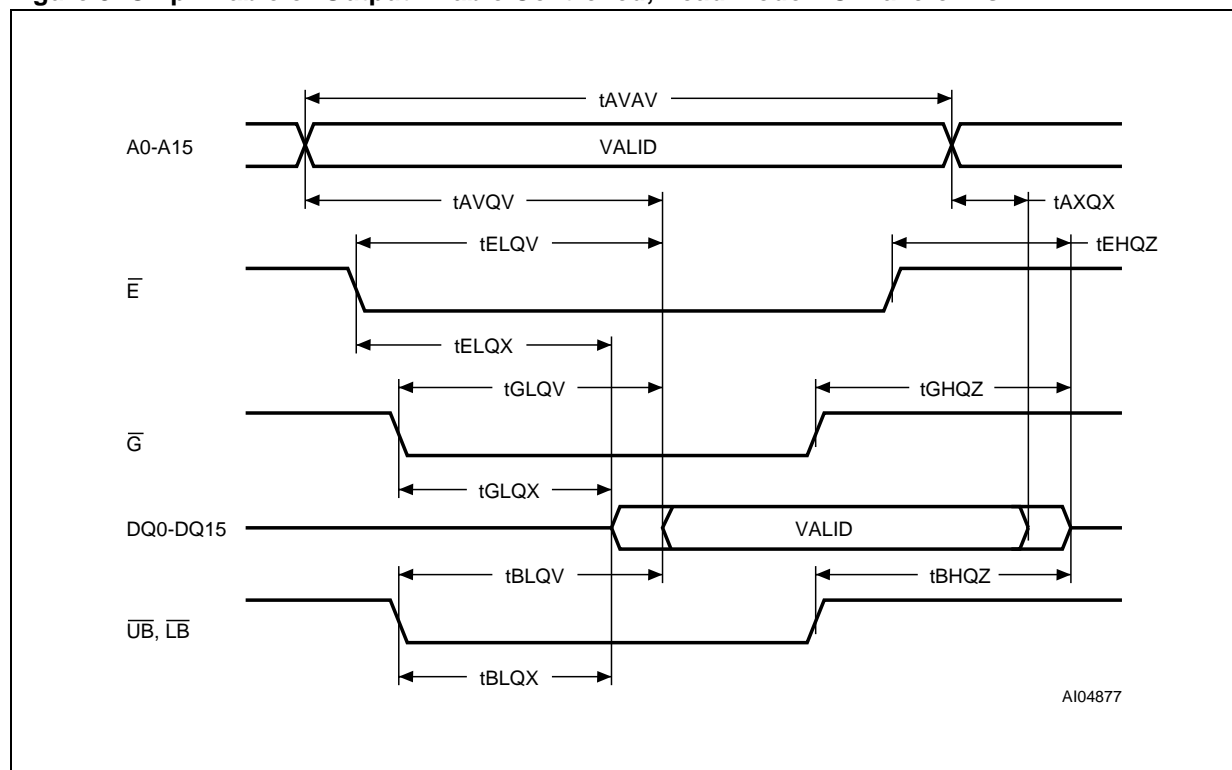

within t_{AVQV} after the last stable address, providing $\overline{\text{G}}$ is Low and $\overline{\text{E}}$ is Low. If Chip Enable or Output Enable access times are not met, data access will be measured from the limiting parameter (t_{ELQV} , t_{GLQV} or t_{BLQV}) rather than the address. Data out may be indeterminate at t_{ELQX} , t_{GLQX} and t_{BLQX} but data lines will always be valid at t_{AVQV} .

Note: $\overline{\text{E}} = \text{Low}$, $\overline{\text{G}} = \text{Low}$, $\overline{\text{W}} = \text{High}$, $\overline{\text{UB}} = \text{Low}$ and/or $\overline{\text{LB}} = \text{Low}$.

Note: 1. At any given temperature and voltage condition, t_{GHQZ} is less than t_{GLQX}, t_{BHQZ} is less than t_{BLQX} and t_{EHQZ} is less than t_{ELQX} for any given device.

2. C_L = 5pF.

Write Mode

The M68AW064F is in the Write mode whenever the \overline{W} and \overline{E} are Low. Either the Chip Enable input (\overline{E}) or the Write Enable input (\overline{W}) must be deasserted during Address transitions for subsequent write cycles. When \overline{E} (\overline{W}) is Low, and \overline{UB} or \overline{LB} is Low, write cycle begins on the \overline{W} (\overline{E})'s falling edge. Therefore, address setup time is referenced to Write Enable as t_{AVWL} and to Chip Enable as t_{AVEL} and is determined by the latter occurring edge.

The Write cycle can be terminated by the earlier rising edge of \overline{E} or \overline{W} .

If the Output is enabled ($\overline{E} = \text{Low}$, $\overline{G} = \text{Low}$, \overline{LB} or $\overline{UB} = \text{Low}$), then \overline{W} will return the outputs to high impedance within t_{WLQZ} of its falling edge. Care must be taken to avoid bus contention in this type of operation. Data input must be valid for t_{DVWH} before the rising edge of Write Enable, or for t_{DVEH} before the rising edge of \overline{E} , whichever occurs first, and remain valid for t_{WHDX} and t_{EHDX} respectively.
